EXPLANATION OF REFERENCE STYLE

THE references have a uniform typographical style but the manner of referring to particular works varies in certain respects The Explanation of Reference Style describes the typographical construction of the references, with some comment on the variations It is divided into four parts

I General Typographical Style

II Style of Bible References

III Punctuation Symbols Abbreviations

IV Table of Authors Titles, and Author s Divisions Cited

I GENERAL TYPOGRAPHICAL STYLE

The two examples below illustrate the general typographical pattern of the references to *Great Books of the Western World* and the headings above the examples call attention to the five elements commonly present in the construction of the references

Volume Number	Author's Name	Title of Work	Author's Divisions	Page Sections
35	Locke	*Human Understanding*	BK II CH XXI	178a 200d
41	Gibbon	*Decline and Fall*		365b 378d

(1) Volume Number

The volume number indicates in which volume of *Great Books of the Western World* the work or passage referred to can be found Most volumes contain the work of one author When a single volume contains the works of two or more authors the volume number is given for each author When the work of a single author is contained in two volumes the volume number is assigned according to the contents of the volume

(2) Author s Name

The author s name immediately follows the volume number except in the case of the American State Papers and the Federalist, which are included in Volume 43 Authors names are usually given in shortened form.

(3) Title of Work

The title follows the author s name with the two exceptions above noted Titles are also frequently abbreviated or shortened When two or more works are cited for a single author the titles are listed in the order in which the works appear in the volume

(4) Author s Divisions

By author s divisions is meant all such subdivisions of a work as book part section chapter paragraph line number The phrase author s divisions does not necessarily mean divisions made by the author they may have been made by an editor of his work

Author s divisions are given only for some works according as in the judgment of the editors their inclusion would prove meaningful or helpful to the reader References to Locke for instance as in the example always cite author s divisions whereas references to Gibbon as in the example do not

For some works author s divisions are completely given as for Locke For other works only the most important or largest divisions are given Thus for Rabelais only the book but not the chapter is given

Line numbers in brackets are given for all works of poetry, including those published in prose translations For Goethe s *Faust* the line numbers cited refer to the lines of the English translation as well as to the lines of the original German *For other poetical works in translation—the* works of Homer the Greek dramatists Lucretius Virgil and Dante—the line numbers cited refer to the lines of the works in their original languages for these works the line numbers printed on the pages of this edition furnish only an approximate indication of the location of the *equivalent lines in the English translation For all poetical works written in English the line numbers are the numbers of the English lines In the* case of Chaucer s *Canterbury Tales* the numbering of the lines is consecutive for all the tales written in verse

In references to the works of Aristotle (in Volumes 8 and 9) the figures and letters enclosed in the brackets signify the page column and approximate line in the Berlin edition of the Greek text edited by Immanuel Bekker *In references to the American State Papers* (*in Volume* 43)

the bracketed line numbers refer to the lines on the pages of this edition only

In references to the *Summa Theologica* of Thomas Aquinas (in Volumes 19 and 20) the author s division Part I–II stands for Part I of the Second Part and Part II–II stands for Part II of the Second Part In the case of the *Summa Theologica* the author s divisions cited may include not only questions and articles but the subdivisions of articles In such cases the page sections correspond in extent to that of a whole article to enable the reader to see the subdivision of an article when it is cited in the context of other parts to which it is related

Author s divisions precede page sections except in the case of footnote and note numbers which follow page sections When more than one passage is cited within the same author s division the author s division is not repeated, as, for example

38 ROUSSEAU *Social Contract* BK II 403a 404a 405d 406a

(5) Page Sections

The pages of *Great Books of the Western World* are printed in either one or two columns The upper and lower halves of a one-column page are indicated by the letters a and b When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand column the letters c and d to the upper and lower halves of the right hand column These half and quarter page sections are based on divisions of a full text page

Page sections give the page numbers and locate the sections of the page in which the passage referred to begins and ends For example in the reference

53 JAMES *Psychology* 116a 119b

the passage cited begins in the upper half of page 116 and ends in the lower half of page 119 In the reference

7 PLATO *Symposium* 163b 164c

the passage cited begins in the lower half of the left hand column of page 163 and ends in the upper half of the right hand column of page 164

In references to works printed in two columns the format of the page

sometimes places continuous reading matter in the a and c sections of the upper half of the page, or in the b and d sections of the lower half of the page This occurs when a work or an author s division begins in the lower or ends in the upper half of the two column page Where continuous reading matter thus appears in discontinuous page sections it is indicated by a c or b d For example

14 PLUTARCH *Solon* 64b d 77a c

means that the work cited begins in the lower half of page 64 and ends in the upper half of page 77

Footnotes or notes are sometimes specifically cited by themselves in the references in which case the page sections given correspond to their location on the pages referred to When a footnote or a note is not specifically cited the page sections given mark the beginning and the end of the text referred to The reader is expected to consult the footnotes or notes indicated in the body of that text

Chaucer s works (in Volume 22) are printed in two columns the inside column of each page contains the Middle English text the outside column a Modern English version Since both columns contain equivalent passages the references to this volume employ page sections (a and b) which divide each page only into an upper and a lower half

II STYLE OF BIBLE REFERENCES

All Bible references are to book chapter and verse in both the King James and Douay versions of the Bible When the King James and Douay versions differ in the title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (*D*) follows For example

OLD TESTAMENT *Nehemiah* 7 45—(*D*) *II Esdras* 7 46

In references to the Bible a colon is used to separate chapter and verse numbers and a comma separates the numbers of verses in the same chapter For example

OLD TESTAMENT *Exodus* 6 1–4 16–18

III PUNCTUATION SYMBOLS, ABBREVIATIONS

(1) Punctuation

Diagonal line When a series of references to one author includes two or more of his works published in the same volume a diagonal line is used to separate references to one work from references to another The diagonal line is used in the same way to separate references to different books of the Bible. For example

OLD TESTAMENT *Exodus* 33 12–23 / *Job* 11 7–9
43 MILL *Liberty* 302d 303a / *Representative Government* 327b d 332d

Semi Colon When a series of references includes the citation of two or more passages in the same work a semi-colon is used to separate the references to these passages For example

OLD TESTAMENT *Genesis* 1 12–14 9 1–11
38 ROUSSEAU *Social Contract* BK II 403a 404a 405d 406a
46 HEGEL *Philosophy of History* PART II 265c 266a PART IV 346c 348a

Comma When a comma separates the title of a work, or an author s division of a work from the page sections which follow passages cited are only a part of the whole work or of the author s division indicated For example in the references

14 PLUTARCH *Lycurgus* 36a b 44d-45c
36 SWIFT *Gulliver* PART II 73a 74b

the passages from Plutarch are only a part of *Lycurgus* and the passage from Swift is only a few pages from Part II of *Gulliver s Travels*

When the title of a work or an author s division of a work is *not* separated by a comma from the page sections which follow the reference is to the whole work or to the whole of the indicated author s division For example in the references

14 PLUTARCH *Lycurgus* 32a-48d
36 SWIFT *Gulliver* PART II 45a 87b

the whole of *Lycurgus* and the whole of Part II of *Gulliver s Travels* are cited

(2) Symbols

esp The abbreviation esp precedes one or more especially relevant passages which are contained within the page boundaries of a larger passage or a whole work that has just been cited

Whenever passages contained within a single reference are especially referred to a comma after the page sections separates these passages For example

> 42 KANT *Science of Right* 435a 441d esp 435c 436b 437c-d 438d 441d

Whenever passages contained within a single reference to the Bible are especially referred to a comma is also used to separate these passages For example

> NEW TESTAMENT *Romans* 1–8 esp 2 11–16 2 27–29 7 21–25 8 27

passim The word passim following a reference signifies that the work or passage referred to discusses the topic under which it is cited, intermittently rather than continuously For example

> 9 ARISTOTLE *Politics* BK II CH 7 461d 463c passim / *Athenian Constitution* CH 1–41 553a 572d passim

(3) Abbreviations

The following is a list of the abbreviations used in the references Unless an abbreviation for the plural is listed below the singular abbreviation is used for both singular and plural words

A	ARTICLE	[n]	note
AA	ARTICLES	OT	OLD TESTAMENT
ANS	ANSWER	par	paragraph

[fn]	footnote	TR	TRACTATE
INTRO	INTRODUCTION		

IV TABLE OF AUTHORS TITLES AND AUTHOR S DIVISIONS CITED

The following pages present a tabulation of the contents of *Great Books of the Western World,* Volumes 4–54 The authors are enumerated in the order in which they appear in the successive volumes of the set and under each author s name the titles of his works are listed in the order of their appearance

In the references the name of the author is frequently given in shortened form In this table their full names are given followed by their life dates when these are ascertainable Because some volumes contain the works of two or more authors who may be separated by centuries the order in which the authors are cited in the references sometimes departs from the strict chronological order The life dates help the reader to place the authors and their works in the right chronological order

In the references the title of a work is frequently given in an abbreviated or shortened form In this table the titles are first given exactly as they appear in the references Whenever this is an abbreviated or shortened title the full title follows

The table also includes a notation of the author s divisions that are used in references to particular works

---

A dash in the column head d Author s D is ns C ted means that references to the work or works in question cite pag sections only Wh re the author s d visions c ted a e the same for several t tles they are na ned only once either opposite the set of titles as a wh le or opposite the last t tle n the group

Titles in brackets are collect ve titl s which appear on the title p ge of the wo k but do not appear in the refe ences The names of the autho s of *The Federa'ist* (in V lume 43) are bracketed because they do not ppear in the references

THE GREAT IDEAS II

Chapters 51–102. MAN *to* WORLD

Chapter 51 MAN

INTRODUCTION

WHETHER or not the proper study of mankind is man it is the only study in which the knower and the known are one in which the object of the science is the nature of the scientist If we consider every effort men have made in response to the ancient injunction know thyself then psychology has perhaps a longer tradition than any other science But by a stricter conception of science more is required than individual insight or self consciousness Definitions principles analyses applicable to all men must be established and it has been questioned whether the method of introspection suffices for this purpose What methods should be used by the psychologist depends in part upon the precise object and scope of his inquiry According as different subject matters and different methods define psychology there seem to be several disciplines bearing that name each with its own tradition in western thought

In one conception psychology begins with the dialogues of Plato and with Aristotle s treatise *On the Soul* As Aristotle s title indicates and as the Greek roots of the word psychology connote the soul rather than man is the object of the science Anthropology Kant later *suggests* would be a more appropriate name for the science of man The Greek inquiry into the soul extends beyond man to all living things. It is because the soul is in some sense the principle of animal life Aristotle writes that the knowledge of the soul admittedly contributes greatly to the advance of truth in general and above all *to our understanding* of Nature

Nevertheless psychology for the Greeks is principally concerned with the study of man The analysis of the parts or faculties of the human soul is an analysis of the properties of human nature—the powers which man has and the characteristically human acts or functions he can perform The methods by which this analysis is developed are for the most part the same methods which the Greek philosophers use in physics The study of the soul Aristotle writes falls within the science of Nature The definitions of the psychologist like those of the physicist give a certain mode of movement of such and such a body (or part or faculty of a body) by this or that cause and for this or that end In the case of the human soul however the psychologist can employ a method not applicable to other things The human intellect is able to examine itself Mind can thus know things about mind which are not otherwise observable

The subject matter of psychology narrows somewhat when at a later moment in the tradition the study of mind tends to replace the study of man This narrowing takes place gradually Though Descartes identifies soul with mind or intellect he treats of the passions and the will as well as thought and knowledge Differing from Descartes with regard to body and soul Hobbes and Spinoza also give as much attention to the emotions as to ideas and reasoning But with Locke Berkeley and Hume there is an increasing tendency to analyze the contents of consciousness and the acts of the understanding treated exclusively as a faculty of thinking or knowing Where in the earlier tradition the observation of human behavior and the behavior of other animals appears to be useful in psychology here the main source of psychological knowledge seems to be introspection

The *Principles of Psychology* by James and the writings of Freud represent a return to the broader conception of the science According to James it is better to let the science be as vague as its subject if by so doing we can throw any light on the main business in hand

boasts may be found in an incipient or even sometimes in a well developed condition in the lower animals They are also capable of some inherited improvement as we see in the domestic dog compared with the wolf or jackal If it could be proved that certain high mental powers such as the formation of general concepts self consciousness etc. were absolutely peculiar to man which seems extremely doubtful it is not improbable that these qualities are merely the incidental results of other highly advanced intellectual faculties and these again mainly the result of the continued use of a perfect language Such a view clearly takes the position that man varies from other animals in the same way that one species of animal varies from an other

Those who take the opposite position do not always agree on the precise nature of the difference in kind For the most part they attribute rationality to man alone and use the word brute to signify that all other animals totally lack reason no matter how acute their intelligence or the apparent sagacity of their instinctive reactions Milton for example in common with many others describes man as

a creature v ho not p one
And brute as oth r creatures but endued
With sanctity of reason might erect
His stature and up ight v ith front s ene
Gove n the rest self kn ı g a d f om thence
Magnanimous to co respond with heaven

Those who find a difference in kind between man and other animals also tend to think that human society and human language are essentially different from the beehive or the ant mound from bird calls jungle cries or parroting because they are the work or expression of reason Unlike Darwin some of them find in human speech not the cause of man s *apparent* difference in kind from other animals but the consequence of his *real* difference in kind—his distinctive rationality The fact that man does certain things that no other animal does at all means to them that man possesses certain powers which no other animal shares to any degree even the slightest They would therefore interp et Darwin s admission that an anthropoid ape could not fashion a stone into a tool or follow a train of metaphysical reasoning or solve a mathematical problem or reflect on God or admire a grand natural scene as an indication that the ape totally lacked human reason or intellect however acute his animal intelligence But the writers who agree that man is radically different from the brutes do not all agree in the account they give of human reason nor do they all affirm free will as the natural accompaniment of rationality

Locke for example begins his essay on *Human Understanding* with the remark that the understanding sets man above the rest of sensible beings Men and other animals alike have the powers of sense memory and imagination but he says brutes abstract not The power of abstracting is not at all in them This power of having general ideas is that which puts a perfect distinction betwixt man and brutes and is an excellency which the faculties of brutes do by no means attain to But Locke denies that man has free will in the sense of a free choice among alternatives Rousseau on the other hand declares that every animal has ideas and it is only in degree that man differs in this respect from the brute It is not therefore so much the understanding that constitutes the specific difference between the man and the brute as the human quality of free agency and it is particularly in his consciousness of this liberty that the spirituality of his soul is displayed

James agrees with Locke that it is probable that brutes neither attend to abstract characters nor have associations by similarity but it is the latter fact which James himself makes the principal distinction between man and brute We may he asserts consider it proven that the most elementary single difference between the human mind and that of brutes lies in this deficiency on the brute s part to associate ideas by similarity James enumerates other classical *differentiae* of man besides that of being the only reasoning animal Man has been called he says the laughing animal and the talking animal but these d stinctive traits like human reasoning James regards as consequences of his unrivalled powers to associate ideas by similarity

Reason and speech are for James the effects where for Adam Smith they are the cause of man s pecul arly human attributes 'The propensity to truck b rte and exchange one

thing for another Smith writes is common to all men and to be found in no other race of animals. This seems to him to be a necessary consequence of the faculties of reason and speech which are peculiar to man Hobbes as we shall see presently takes still another position since he explains man s reasoning power in terms of his faculty of speech a faculty which is possessed by no other animal

Despite all these variations in theory or explanation writers like Locke Rousseau James Smith and perhaps Hobbes seem to agree that man and brute differ in kind On that point they agree even with writers like Plato Aristotle Augustine Aquinas Descartes Spinoza Kant and Hegel who hold as they most definitely do not that man has a special faculty of mind reason or intellect The contradictory position is, therefore not to be found in the denial of some particular theory of reason but rather in the denial that any faculty or attribute which man possesses warrants our calling him rational and other animals brute

THE ISSUE is sharply drawn between these contradictory positions Yet it is avoided by those who go no further than to see in human civilization certain distinctive features such as the arts and sciences or law government and religion Mill for example discussing the sentiment of justice finds its root in the natural impulse to resent and to repel or retaliate any harm done or attempted against ourselves or against those with whom we sympathise common to all animal nature Man differs from other animals he writes first in being capable of sympathising not solely with their offspring or like some of the more noble animals with some superior animal who is kind to them but with all human and even with all sentient beings Secondly in having a more developed intelligence which gives a wider range to the whole of their sentiments whether self regarding or sympathetic By virtue of his superior intelligence even apart from his superior range of sympathy a human being is capable of apprehending a community of interest between himself and the human society of which he forms a part

A view of this sort would seem to leave open the question whether such typically human developments signify the possession by man of special powers which set him apart as *different in kind* While admitting extraordinary differences between the behavior or accomplishments of men and other animals this view does not reject the possibility that such accomplishments may represent merely wide differences in degree of power which give the *appearance* of differences in kind

As we have already observed the issue about man and brute cannot be separated from the controversy about the so-called higher faculties of man Except for the view that man is a purely spiritual being who merely inhabits or uses a physical body no theory of human nature doubts that man as a living organism possesses in common with plants and animals certain bodily powers or functions The vegetative functions which Galen calls the natural faculties are indispensable to human as to all other forms of corporeal life Similarly the powers of sensitivity and appetite or desire are obviously present in man as in other animals To the observer who sees only the externals of human and animal behavior men and the higher animals appear to react to the physical stimulation of their sense organs with a similar repertoire of bodily movements which vary only as their skeletal structure and their organs of locomotion differ They also manifest outward signs of inner emotional disturbance sufficiently similar to warrant treating emotions like fear and rage as common to men and other animals

On all this there seems to be little dispute in the tradition of the great books But difficult questions arise when the inner significance of these external movements is considered Both men and animals have the familiar sense organs and such powers as touch taste smell hearing and vision But do sensations give rise to knowledge in the same way for both men and animals? Do the powers of memory and imagination extend an animal s range of apprehension as they do man s? Do these powers affect the perception of present objects in the same way for men and animals?

Such questions are not readily answered by observation of external behavior alone What seems to be called for—a comparison of human and animal experience—cannot be obtained The difficulty of the problem becomes most in-

tense when a special faculty of knowledge or thought is attributed to man for animal and human sense perception, imagination or even emotion may be incommensurable if a special factor of understanding or reason enters into all human experience and is totally absent from that of animals

In the ancient and mediaeval periods the sensitive faculty including the interior sensitive powers of memory and imagination is generally distinguished from another faculty variously called intellect reason or mind Writers like Plato Aristotle Plotinus Lucretius Augustine and Aquinas have different conceptions of *intellect or mind in itself* and *in its relation* to sense and imagination but they do not question its existence as a separate faculty The range of the sensitive powers does not extend to ideas or intelligible objects nor is sensitive memory or imagination for them the same as rational thought

Not only does it seem unquestionable in the ancient and mediaeval tradition that man has these two distinct faculties of knowledge but it is generally assumed that other animals have to a greater or less degree the power of the senses alone Only men can understand as well as perceive only men can know the universal as well as the particular only men can think about objects which are neither sensible nor strictly imaginable—objects such as atoms and God the infinite and the eternal or the intellect itself The affirmation of an essential difference between reason and sense seems to be inseparable from the affirmation of an essential difference between men and brutes

DOUBTS OR DENIALS with regard to both affirmations achieve considerable prevalence in modern times But though the two affirmations appear inseparable they are not always denied together Montaigne for example does not so much doubt that men have reason as he does that other animals lack it He considers the matter in the light of external evidences in terms of the comparable performances of men and animals The light of reason seems to shine in both

He repeats many stories from Plutarch and Pliny which supposedly reveal the comparable mentality of animals and men One is the story of the hound who following the scent comes to a triple parting of the ways After sniffing along the first and second paths and discovering no trace of the scent the hound without a moment s hesitation or sniffing takes up the pursuit along the third trail This Montaigne suggests is a kind of syllogizing as if the dog reasoned thus with himself I have followed my master by foot to this place he must of necessity be gone by one of these three ways he is not gone this way nor that he must then infallibly be gone this other

It is noteworthy that Aquinas tells exactly the same story in order to make the point that *such appearances of reasoning in animals can be* explained as instinctively determined conduct In the works of irrational animals he writes we notice certain marks of sagacity in so far as they have a natural inclination to set about their actions in a most orderly manner through being ordained by the supreme art For which reason too certain animals are called prudent or sagacious and not because they reason or exercise any choice about things That such behavior is not the work of reason he claims is clear from the fact that all that share in one nature invariably act in the same way

Unlike Montaigne Machiavelli seems to imply that men and brutes are alike not in having reason, but in lacking it The passions control behavior Intelligence exhibits itself largely as craft or cunning in gaining ends set by the passions Man is no less the brute in essence because in the jungle of society he often succeeds by cunning rather than by force He may have more cunning than the fox but without armor he also has less strength than the lion The prince Machiavelli remarks being compelled knowingly to adopt the beast ought to choose the lion and the fox because the lion cannot defend himself against snares and the fox can not defend himself against wolves

For the most part however the modern dissent from the ancient and mediaeval view takes the form of denying that reason and sense are distinct powers In its most characteristic expression this denial is accompanied by a denial of abstract ideas as in the writings of Hobbes Berkeley and Hume Their position discussed more fully in the chapter on UNIVERSAL AND PARTICULAR is that men only give t

ance of having ab tract or general ideas because they employ common names which have gen eral significance

Language according to Hobbes is the root of all other differences between man and brute Sense and imagination are common to man and beast Rea oning or the train of thoughts can take place in any animal which has memory and imagination But that type of understand ing which Hobbes describes as conception caused by speech is peculiar to man His state ment that by the help of speech and method the same faculties which belong to both men and beasts may be improved to such a height as to distinguish men from all other living crea tures would seem to imply that Hobbes re gards man as superior to other animals only in degree Yet on the other hand he enumerates a variety of institutions peculiar to human life such as religion law and science which imply a difference in kind

Like Hobbes Berkeley thinks that men use general names but do not have general or abstract ideas But he seems much less willing than Hobbes to assert man s clear superiority even on the basis of man s attainments through the power of speech If the fact that brutes abstract not he says in reply to Locke be made the distinguishing property of that sort of ani mals I fear a great many of those that pass for men must be reckoned into their number

Hume goes further than either Berkeley or Hobbes Agreeing with them that man has no faculty above sense and imagination and hence no faculty which animals do not also possess he alon explicitly draws the conclusion which that implies

Animals as well as men he writes learn *many things from experience and infer that the* same events will always follow from the same causes Such inferences in animals or men are not founded on any process of argument or reasoning They are the result of the operation of custom and instinct Were this doubtful with regard to men it seems to admit of no question with regard to the brute creation and the conclusion being once firmly established in the one we have a strong presumption from all the rules of analogy that it ought to be univer sally admitted without any exception or re serve

But if custom and instinct underlie the appearance of rea oning in both men and animals it may be asked says Hume how it happens that men so much surpass animals in reasoning and one man so much surpasses another? His answer seems to be entirely in terms of degree of the same factors Th same sort of difference which obtains between a superior and an inferior intelligence among men obtains between men and other animals

All the evidence which Darwin later assem bles on the characteristics of human mentality is offered by him in proof of the same point But to those who think that man alone has an intel lect or a rational faculty over and above all his sensitive powers such evidence remains in on clusive As in the case of the dog whose behav ior Aquinas and Montaigne interpret different ly the same observed facts seem to be capable of quite opposite explanation by those who hold opposite theories of human and animal intelli gence

Is THERE INTERNAL evidence obtained from man s introspective experience of his own thought which can resolve the controversy? As Descartes sees it the interpretation of such evidence also seems to depend on the prior assumption one makes about the sameness or differen e of men and brutes

We cannot help at every moment experi encing within us that we think he writes nor can anyone infer from the fact that it has been shown that the animate brutes can discharge all these operations entirely without thought that he therefore does not think unless it be that having previously persuaded himself that his actions are entirely like those of the brutes just because he has ascribed thought to them he were to adhere so pertinaciously to these very words *men and brutes operate in the s m way* that when it was shown to him that the brutes did not think he preferred to divest himself of that thought of his of which he could not fail to have an inner consciousness rather than to alter his opinion that he acted in the same way as the brutes

On th other hand Descartes continues those who hold *that thought is not to be distinguished from bodily motion* will with much better rea son conclude that it is the same thing in us and

in them since they notice in them all corporeal movements as in us they will add *that a difference merely of greater and less makes no difference to the essence* and will infer that though per chance they think that there is less reason in the beasts than in us our minds are of exactly the same species

THE ISSUE concerning the senses and the rea son is more fully discussed in the chapters on MIND and SENSE and also in the chapters on IDEA and UNIVERSAL AND PARTICULAR where the problem of abstract ideas or universal no tions is considered The issue concerning soul in general and the human soul in particular be longs primarily to the chapter on SOUL and also to the chapter on MIND But like the issue about sense and intellect its bearing on the problem of man s nature deserves brief com ment here

The question is not whether man has a soul but whether only man has a soul a rational soul a soul which is in whole or in part imma terial a soul capable of separate existence from the body an immortal soul If soul is conceived as the principle of life in all living organisms—as Aristotle conceives it—then having a soul does not distinguish man from plants or ani mals If furthermore the rational soul is distinguished from the sensitive and vegeta tive soul in the same way that men are distin guished from brute animals and plants namely by reference to certain powers such as intel lect and will then the statement that men alone have rational souls would seem to add nothing to the statement that men alone are rational

But if the human soul through being ra tional confers a mode of immaterial or spirit ual being upon man then man s possession of such a soul sets him apart from all other physi cal things even further than the special power of reason separate him from the brutes The position of Lucretius illustrates this distinction in reverse He does not deny that man has a soul Unlike other living things which also have souls man s soul includes a special part which Lucretius calls mind He describes it as the part which we often call the understand ing in which dwells the directing and govern ing principle of life [and] is no less part of the man than hand and foot and eyes are parts of the whole living creature

So far as his having this special faculty is con cerned man is set apart But for Lucretius noth ing exists except atoms and void Consequently the nature of the mind and soul is bodily consisting of seeds exceedingly round and ex ceedingly minute in order to be stirred and set in motion by a small moving power In his physical constitution man does not differ in any fundamental respect from any other composite thing The materiality of his soul furthermore means that it is as perishable as any composite body

At the other extreme from Lucretius Des cartes conceives man as a union of two sub stances I possess a body he writes with which I am very intimately conjoined yet be cause on the one side I have a clear and dis tinct idea of myself inasmuch as I am only a thinking and unextended thing and as on the other I possess a distinct idea of body as it is only an extended and unthinking thing it is certain that this I (that is to say my soul by which I am what I am) is entirely and abso lutely distinct from my body and can exist without it Nevertheless sensations of pain hunger thirst etc lead Descartes to add I am not only lodged in my body as a pilot in a vessel but I am very closely united to it and so to speak so intermingled with it that I seem to compose with it one whole

Only man has a dual nature thus compound ed Other living things Descartes seems to hold are merely bodies having the structure and op eration of complex machines If like the *automata* or moving machines made by the in dustry of man there were such machines possessing the organs and outward form of a monkey or some other animal without reason we should not have any means of ascertain ing that they were not of the same nature as those animals

It is indifferent to Descartes whether other animals are conceived as automata or whether because they have life sensation and imagina tion they are granted souls I have neither denied to the brutes he writes what is vul garly called life nor a corporeal soul or organic sense What he has denied is thought and it is this one factor which makes it impossible for a

machine to imitate human speech and action It is this one factor which also requires man s soul unlike that of the brute to be an incorporeal substance

Unlike sensations and passions acts of thought and will according to Descartes cannot be functions of bodily organs Even though I were to grant he says that thought existed in dogs and apes it would in nowise follow that the human mind was not to be distinguished from the body but on the contrary rather that in other animals also there was a mind distinct from their body When Descartes affirms man s uniqueness he is therefore affirming more than that man alone has reason and free will He is affirming that of all things man alone is formed of body and soul —not a corporeal soul but a spiritual substance The angels in contrast are simply spirits

The remark of Plotinus that humanity is poised midway between the gods and the beasts applies with somewhat altered significance to the Cartesian view But there are other conceptions of the human constitution which though they preserve the sense of man s dual nature do not make him a union of two separate substances

Spinoza for example gives man special status in the order of nature by conferring on him alone participation in the divine mind The human mind he writes is a part of the infinite intellect of God The human body on the other hand is a mode which expresses in a certain and determinate manner the essence of God in so far as He is considered as the thing extended Man is thus composed of mind and body but for Spinoza this duality in human nature is a duality of aspects not a duality of substances

There is still another way in which a certain immateriality is attributed to man In Aristotle s theory the soul is not a substance in its own right but the substantial form of an organic body This is true of all kinds of souls—whether of plants animals or men But when Aristotle enumerates the various powers which living things possess—such as the nutritive the appetitive the sensory the locomotive and the power of thinking —he assigns to man alone or possibly another order like man or superior to him the power of thinking *i e* mind Furthermore of all the parts or powers of the soul thinking seems to Aristotle to afford the most probable exception to the rule that all the affections of soul involve body

Apart from thinking there seems to be no case he says in which the soul can act or be acted upon without involving body Whereas the sensitive powers are seated in bodily organs and cannot act except as bodily functions the intellect is immaterial It has no bodily organ which is comparable to the eye as the organ of vision and the brain as the organ of memory and imagination The act of understanding is not a function of physical matter

According to this theory man as a whole is a single substance composite of correlative principles of being—matter and form or body and soul But man differs from all other physical substances which are similarly composite in that he has a faculty and mode of activity separate from matter In the later development of this theory by Aquinas the immateriality of the intellect becomes the basis for arguing that the rational soul of man can exist apart from matter when the composite human substance is disintegrated by death

As indicated in the chapters on IMMORTALITY and SOUL, this is not the only argument for the immortality of the soul We are not here concerned however with the various arguments and their merits but only with the fact that certain conceptions of man s constitution attribute to man something more than the power of rationality namely the distinction of having a spiritual and immortal life

HIS FUTURE AND his past color the present life of man and alter the aspect under which he conceives his place in the general scheme of things Immortality promises release from mutability as well as salvation from death With an immortal soul man belongs to eternity as well as to time He is not merely a transient character in the universe His stature and his dignity are not the same when man regards himself as completely dissolvable into dust

The question of man s past or origin is perhaps even more critical in its bearing on man s present status Ancient poetry and history contain many myths of man s kinship with the gods The heroes trace their lineage back to the

gods. Through them or through the progenitors of the race man conceives himself as of divine descent or at least as having more affinity with the immortal gods than with all other earth bound things

In the *Descent of Man* Darwin paints a different picture of human origin Two propositions determine its general outlines The first already stated is that man belongs to the animal kingdom without any differentiation except in degree Not only in anatomy physiology and embryology are there marks of man s affinity with the mammals man s behavior and mentality also show according to Darwin that man possesses no attribute so peculiarly human that some trace of it cannot be found in the higher forms of animal life

The second proposition is that man s origin on earth has come about by a process of natural variation from an ancestral type exactly as other new species of plants or animals have originated by descent with variation from a common ancestor This theory of the origin of species is discussed in the chapter on EVOLUTION Its special application to the human species involves the notion of a common ancestor for both man and the anthropoid apes and the disappearance not only of the ancestral form but of the intermediate varieties—the so called missing links in the chain of variation

These two propositions are logically interdependent If the proposition is false that man differs from other animals only in degree the proposition cannot be true that man originated along with the anthropoid apes by descent from a common ancestor Conversely if the Darwinian theory of man s origin is true it cannot be true that men and brutes differ in kind But though the truth of each of these two propositions implies the truth of the other the problem of the difference between man and other animals has a certain logical priority over the problem of man s origin simply because more evidence is available to solve it That question calls for an examination of man as he is today in comparison with other extant species whereas the other question necessarily requires the collection and interpretation of historical evidence which may have some bearing on hypothetical missing links

It should be added that if in regard to the first question the evidence favored the affirmation of a difference in kind that would not entail the denial of biological evolution though it would necessarily challenge the Darwinian theory of how such evolution took place One alternative to the Darwinian hypothesis is the theory of emergent evolution according to which lower forms of life may give rise to new organic forms which are not only higher but are distinct in kind

Whether or not Christian theology and some theory of biological evolution can be reconciled there seems to be an inescapable contradiction between Darwin s view of man s origin and the Judaeo-Christian conception of man as a special creation special above all in the sense that God created man in his own image

As God is in essence a perfect intelligence and a spiritual being man according to Aquinas is said to be to the image of God by reason of his intellectual nature In all creatures there is some kind of likeness to God but it is only in man that that likeness is an image Man s finitude imperfection and corporeal existence make the image a remote resemblance yet according to the theologians it is precisely that likeness which separates man from all other earthly creatures and places him in the company of the angels

But man is no more an angel than he is a brute He is separated from the one by his body as from the other by his reason Nor does he in the present life have the spiritual existence of a disembodied and immortal soul To these three negatives in the definition of man—*not* an angel *not* a brute *not* a soul—the Christian theologian adds a fourth drawn from man s past Man is of the race begotten by Adam but he does not have the attributes which Adam possessed before the fall

The dogma of man s fall from grace is discussed in the chapter on SIN Here we are concerned only with its implications for the understanding of man s present nature as not only being deprived of the extraordinary gifts of life and knowledge which Adam lost through disobedience but as also being wounded in perpetuity by Adam s sin Weakness ignorance malice and concupiscence Aquinas declares are the four wounds inflicted on the whole of human nature as a result of our first parent s

sin Man in the world is not only disinherited from Adam s gifts but with the loss of grace he also suffers, according to Aquinas, a diminution in his natural inclination to virtue.

THERE ARE OTHER divisions in the realm of man but none so radical as that between Eden and the world thereafter As retold by Plato the ancient myths of a golden age when men lived under the immediate benevolence of the gods also imply a condition of mankind quite different from the observable reality but they do not imply a decline in human nature itself with the transition from the golden age to the present The modern distinction between man living in a state of nature and man living in civil society considers only the external circumstances of human life and does not divide man according to two conditions of his soul. Other dichotomies—such as that between prehistoric and historic man or between primitive and civilized man—are even less radical for they deal even more in gradations or degrees of the same external conditions.

These considerations lead us to another phase of man s thinking about man Where the previous problem was how man differs from every thing else in the universe here the question is how man is divided from man If men are not equal as individuals, to what extent are their individual differences the result of the unequal endowment of the natures with which they are born and to what extent are they the result of individual acquirement in the course of life?

The range of human differences whether innate or acquired may itself become the basis for a division of men into the normal and the abnormal a division which separates the feeble-minded and the insane from the competent and sane From a moral and political point of view this is perhaps the most fundamental of all classifications. It must be admitted however that traditionally the problem of the difference between men and women and the problem of the difference between the ages of man from the extreme of infancy to the extreme of senility seem to have exercised more influence on the determination of political status and moral responsibility

One other differentiation of man from man seems to have significance for the theory of human society and the history of civilization That is the division of men into groups, sometimes by reference to physical and mental traits which separate one race from another—whether these traits are supposed to be determined biologically as inheritable racial characteristics or are attributed to environmental influences sometimes by reference to the customs and ideals of a culture Both sets of criteria appear to be used in the traditional discussion of the opposition between Greek and barbarian Jew and gentile European and Asiatic.

THE ULTIMATE questions which man asks about himself are partly answered by the very fact of their being asked The answer may be that man is the measure of all things that he is sufficient unto himself or at least sufficient for the station he occupies and the part he plays in the structure of the universe The answer may be that man is not a god overlooking the rest of nature or even at home in the environment of time and space but rather that he is a finite and dependent creature aware of his insufficiency a lonely wanderer seeking something greater than himself and this whole world. Whatever answer is given man s asking what sort of thing he is, whence he comes, and whither he is destined symbolizes the two strains in human nature—man s knowledge and his ignorance man s greatness and his misery

Man writes Pascal is a nothing in comparison with the Infinite an All in comparison with the Nothing a mean between nothing and everything Since he is infinitely removed from comprehending the extremes the end of things and their beginning are hopelessly hidden from him in an impenetrable secret he is equally incapable of seeing the Nothing from which he was made and the Infinite in which he is swallowed up

Man Pascal goes on must not think that he is on a level either with the brutes or with the angels, nor must he be ignorant of both sides of his nature but he must know both. In recognizing both lies his wretchedness and grandeur Man knows that he is wretched He is therefore wretched because he is so but he is really greater because he knows it

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to For example in 4 HOMER *Il ad* BK II [265 283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12

PAGE SECT ONS When the text is printed in one column the letters a and b refer to the upper and lo er halves of the page For example in 53 JAMES *Psychology* 116 119b the passage begins in the upper half of page 116 and ends in the lo r half of page 119 When the text is printed in two columns the letters a and b refer to the upper nd lo er halves of the left hand side of the page the letters c nd d to the upper and lower hal es of the right hand side of the pa e, For example in 7 PLATO *Symposium* 163b-164c, the passage be ins in the lo ver half of th left hand side of page 163 and ends in the upper half f the right hand side of page 164

AUTHOR S DIVISIONS One or more of the main divis ons of a work (such a P RT BK CH SECT) are som times included in the reference line numbers in brackets are given in cer t in cases *e g Il d* BK II [265 83] 12d

Chapter 52 MATHEMATICS

INTRODUCTION

IT is necessary for us to observe the difference between problems *in* mathematics and the problem of the truth *about* mathematics In the case of any science—in physics logic or metaphysics as well as mathematics—it is one thing to examine the discourses or treatises of the scientists on the special subject matter of their field and quite another to examine discussions of the science itself its scope branches and unity its objects its methods and its relation to other disciplines The chapter on QUANTITY deals with the subject matter of arithmetic geometry and other branches of mathematics here we are primarily concerned with the nature of mathematical science itself

Sometimes reflections on the nature of a science are expressed by experts in its subject matter who comment on the scientific enterprise in which they are engaged in prefaces or interspersed remarks Sometimes such reflections are the commentary on a particular science by those who may claim to speak with competence on the processes of the human mind the nature of knowledge or of science in general but who claim no special competence in the particular science under consideration This is usually the commentary of philosophers who may assert their right to make all knowledge as well as all reality their province The same man may of course be both a mathematician and a philosopher as for example Plato Descartes Pascal

In the case of mathematics the disparity between discourse *in* and *about* the science could hardly escape notice Even if no preliminary rule of caution were laid down we should be struck by the contrast between the agreement mathematicians have been able to reach in the solution of their problems and the disagreement of the commentators on basic questions about mathematics To this there may be one significant exception Mathematics is honored for the precision of its concepts the rigor of its demonstrations the certitude of its truth Even its detractors—like Swift or Berkeley—concede the exactitude and brilliance of mathematics while questioning its utility or they admit its intellectual austerity while challenging some application of its method Its clearness and certainty of demonstration Berkeley writes is hardly anywhere else to be found

This general agreement about the quality of mathematical thought may explain why in all epochs mathematics has been looked upon as the type of certain and exact knowledge Sometimes it is taken as more than a model for other sciences it is regarded as the method of pure science itself or as the universal science Sometimes its excellences are thought to be qualified by the limited or special character of its objects or it is contrasted with other disciplines which employing different methods deal with more fundamental matters no less scientifically But always the conclusions of mathematics serve to exemplify rational truth always the method of mathematics represents the spirit of dispassionate thought always mathematical knowledge symbolizes the power of the human mind to rise above sensible particulars and contingent events to universal and necessary relationships

Mathematics means this not only to mathematicians and philosophers but also to moralists and statesmen The objects of geometrical inquiry writes Alexander Hamilton are so entirely abstracted from those pursuits which stir and put in motion the unruly passions of the human heart that mankind without difficulty adopt not only the more simple theorems of the science but even those abstruse paradoxes which however they may appear susceptible of demonstration are at variance with the natural conceptions which the mind without the aid

of philosophy would be led to entertain upon the subject But in the sciences of morals and politics men are found far less tractable This Hamilton points out is not due merely to the passionate interest in their problems It cannot be pretended he says that the principles of moral and political knowledge have in general the same degree of certainty with those of mathematics

ADMIRATION FOR MATHEMATICS often extends beyond enthusiasm for its exemplary virtues or delight in its intellectual beauty to the recognition of its influence on the whole history of thought Yet here differences of opinion begin to appear

In the ancient world Plato and Aristotle represent opposite estimates of the importance of mathematics for the rest of philosophy For the Platonists Aristotle says mathematics has come to be identical with philosophy though they say that it should be studied for the sake of other things He complains of those students of science who do not listen to a lecturer unless he speaks mathematically They make the error of supposing that the minute accuracy of mathematics is to be demanded in all cases whereas according to Aristotle s own view its method is not that of natural science

In the modern world thinkers who are both mathematicians and philosophers like Descartes and Whitehead represent a return to the Platonic point of view while Kant even more than Aristotle insists that the philosopher is grievously misled if he tries to follow the method of mathematics in his own inquiries Whitehead charges Aristotle with having deposed mathematics from its high role as a formative element in the development of philosophy —a demotion which lasted until with Descartes and others in the 17th century mathematics recovered the importance it had for Plato

Attempting to qualify his own enthusiasm Whitehead admits that he would not go so far as to say that to construct a history of thought without a profound study of the mathematical ideas of successive epochs is like omitting Hamlet from the play which is named after him That would be claiming too much But it is certainly analogous to cutting out the part of Ophelia This simile is singularly exact For Ophelia is quite essential to the play she is very charming—and a little mad Let us grant that the pursuit of mathematics is a divine madness of the human spirit a refuge from the goading urgency of contingent happenings

For Kant the madness lies not in the pursuit of mathematics itself but in the delusion of the philosopher that he can proceed in the same way The science of mathematics Kant writes presents the most brilliant example of how pure reason may successfully enlarge its domain without the aid of experience Such examples are always contagious particularly when the faculty is the same which naturally flatters itself that it will meet with the same success in other cases which it has had in one The expectation naturally arises that the method of mathematics would have the same success outside the field of quantities But philosophers who understand their own task Kant thinks should not be infected by the confidence of those who are masters in the art of mathematics as to their ability of achieving such success by applying its method in other fields

The exactness of mathematics Kant holds depends on definitions axioms and demonstrations None of these can be achieved or imitated by the philosopher in the sense in which they are understood by the mathematician because according to Kant the validity of the mathematician s definitions and demonstrations ultimately depends on the fact that he is able to *construct* the concepts he uses The point is not that mathematics obtains its objects from reason rather than experience but rather that it obtains them from reason by construction as for example Euclid begins by constructing a triangle which corresponds with his definition of that figure

Hence Kant maintains we must not try in philosophy to imitate mathematics by beginning with definitions except it be by the way of experiment In philosophy in fact the definition in its complete clearness ought to conclude rather than begin our work whereas in mathematics we cannot begin until we have constructed the objects corresponding to our definitions It follows from all this Kant concludes that it is not in accordance with the

very nature of philosophy to boast of its dog matical character particularly in the field of pure reason and to deck itself with the titles and ribands of mathematics

Differences of opinion about mathematics represent for the most part philosophical controversy concerning the nature of science or the objects of its knowledge Mathematicians who engage in such controversy assume the role of philosophers in doing so for mathematics itself is not concerned with questions of this sort But there are some questions about mathematics which seem to call for a close study of the science itself and even for proficiency in its subject matter and operations They are questions about the scope of mathematics and about the divisions of the science in relation to one another and to its unity On these issues mathematicians disagree not only with philosophers but among themselves and in their capacity as mathematicians

These issues usually involve different interpretations of the history of mathematics The problem is not one of the origin of mathematics

The ancient opinion found in Herodotus Plato and Aristotle that the mathematical arts especially geometry were first developed by the Egyptians is of interest because of the questions it raises about the circumstances of the origin of mathematics Herodotus seems to suggest that geometry arose as an aid in the practice of surveying land From this practice he says geometry first came to be known in Egypt whence it passed into Greece Aristotle on the other hand separating from the useful arts those which do not aim at utility thinks the latter arose first in the places where men first began to have leisure That is why the mathematical arts were founded in Egypt for there the priestly caste was allowed to be at leisure

The Greek development of mathematics very early distinguishes between the pure sciences of arithmetic and geometry and their useful applications in the arts of measurement The Greeks conceived mathematics as essentially speculative rather than practical or productive They also divorced it from empirical investigation of the sensible world As arithmetic is concerned with numbers not with numbered things and geometry with figures not with physical shapes areas or volumes so Plato points out that music and astronomy belong to the mathematical sciences when they deal not with audible harmonies but with their numerical ratios not with visible celestial motions but with their geometrical configurations

Provoked by Glaucon s interest in the usefulness of the mathematical arts Socrates excludes their utility as being of no interest to the philosopher He recommends arithmetic and its sister disciplines only so far as these sciences entirely ignore the world of sensible things The reason why the philosopher who has to rise out of the sea of change and lay hold of true being must be an arithmetician he explains is that arithmetic can have a very great and elevating effect when it compels the soul to reason about abstract number and rebels against the introduction of visible or tangible objects into the argument In the same way only when it concerns itself with knowledge of the eternal not with measuring earthly distances will geometry draw the soul towards truth and create the spirit of philosophy The astronomer like the geometer should employ problems and let the heavens alone if he would approach the subject in the right way and like the astronomer the student of harmony will work in vain if he compares the sounds and consonances which are heard only and so fails to reach the natural harmonies of number

About the non empirical or non experimental character of mathematics there has been little dispute It is seldom suggested that the growth of mathematical knowledge depends upon improvement in methods of observation But on the relation of mathematics to physics which raises the whole problem of pure and applied mathematics or of mathematical and experimental physics there has been much controversy especially in modern times

Bacon for example adopts the ancient division of mathematics into pure and mixed the former wholly abstracted from matter and physical axioms Though he regards mathematics as a useful instrument in physics— the investigation of nature being best conducted when mathematics are applied to physics —he also insists upon the primacy of physics and

upon its essentially experimental character Physics has been corrupted he says by logic and by mathematics when these seek to dominate instead of to serve it It is a strange fatality that mathematics and logic which ought to be but handmaids to physics should boast their certainty before it and even exercise dominion against it

The certainty and clarity which Hume is willing to attribute to mathematics cannot in his opinion be extended to mathematical physics The most perfect philosophy of the natural kind he thinks only staves off our ignorance a little longer Nor is geometry when taken into the assistance of natural philosophy ever able to remedy this defect or lead us into the knowledge of ultimate causes by all that accuracy of reasoning for which it is so justly celebrated Every part of mixed mathematics Hume continues proceeds upon the assumption that certain laws are established by nature in her operations and abstract reasonings are employed either to assist experience in the discovery of these laws or to determine their influence in particular instances where it depends upon any precise degree of distance or quantity When mixed with physics mathematics remains subordinate—at best an aid in the formulation and the discovery of the laws of nature

A different view seems to be taken by the great mathematicians and physicists of the 17th century Galileo Descartes and Newton tend to make mathematical analysis an integral part of physics As the structure of the world is mathematical so too must the science of nature be mathematical Geometry says Descartes is the science which furnishes a general knowledge of the measurement of all bodies *If we retain the ancient distinction* between geometry and mechanics it can only be in terms of the assumption confirmed by the usage of these names that geometry is precise and exact while mechanics is not

In the preface to his *Mathematical Principles of Natural Philosophy* Newton also says that geometry is founded in mechanical practice and is nothing but that part of universal mechanics which accurately proposes and demonstrates the art of measuring What is called rational mechanics must not be confused with the manual arts of measurement which are imperfect and inexact and it is therefore wrong to distinguish geometry from mechanics as that which is perfectly *accurate from that which is* less so But since the manual arts are chiefly *employed in the moving of bodies it happens* that geometry is commonly referred to their magnitude and mechanics to their motion

Newton himself does not abide by this distinction His aim is to subject all the phenomena of nature to the laws of mathematics and to cultivate mathematics as far as it relates to natural philosophy I offer this work as the mathematical principles of philosophy for the whole burden of philosophy consists in this—from the phenomena of motions to investigate the forces of nature and from these forces to *demonstrate the other phenomena* He regrets that he has not been able to deduce *all* the phenomena of nature by the same kind of reasoning from mechanical principles

Fourier goes even further Mathematical analysis he says is as extensive as *nature itself* Mathematical analysis has necessary relations with sensible phenomena In laying hold of the laws of these phenomena mathematics interprets them by the same language as if to attest the unity and simplicity of the plan of the universe and to make still more evident that unchangeable order which presides over all natural causes Thus much had been said or implied by Descartes and Newton But in addition to all this Fourier from his own experience in developing a mathematical theory of heat comes to the conclusion that profound study of nature is the most fertile source of mathematical discoveries Mathematics itself benefits from its alliance with physics it increases *in analytical power and in the generality of its formulations* as physical inquiries extend the range of phenomena to be analyzed and formulated

THE RELATIONS OF mathematics to physics are considered in the chapters on ASTRONOMY MECHANICS and PHYSICS Mathematical physics must be examined in the light of the opinion that mathematics and physics are *separate* sciences distinct in object and method Further more whereas some of the major contributions to mathematics appear in the great books of

physics or natural philosophy (e g Archimedes Kepler Newton Fourier) even more fundamental formulations of the science occur in great books devoted exclusively to mathematics Euclid s *Elements* (on geometry) Apollonius treatise *On Conic Sections* Nicomachus *Introduction to Arithmetic* Descartes *Geometry* and Pascal s mathematical papers Others belonging to this latter group are listed in the Additional Readings The great modern advances in mathematics are exemplified by the works of Gauss Lobachevski Hamilton Riemann Boole Dedekind Peano Frege Cantor Hilbert

It would be both natural and reasonable to inquire about the relation between the great works of mathematics included in this set and the equally great treatises or monographs listed in the Additional Readings which represent for the most part the contributions of the 19th century But since the major question which immediately confronts us in such an inquiry concerns the relation of modern to ancient mathematics we can examine the problem in terms of the works included in this set for they represent both the continuity and the discontinuity in the tradition of mathematical science

Galileo and Newton are disciples of Euclid and Archimedes Fourier is a disciple of Newton and Descartes But Descartes is the great innovator He seems to be quite self conscious of his radical departure from the ancients and from the state of mathematics as he found it in his own day Yet the truth and power of his mathematical discoveries seem so evident to him that he cannot doubt the ancients must have had some inkling of it

I am quite ready to believe he writes that the greater minds of former ages had some knowledge of it nature even conducting them to it We have sufficient evidence that the ancient Geometricians made use of a certain analysis which they extended to the resolution of all problems though they grudged the secret to posterity At the present day also there flourishes a certain kind of Arithmetic called Algebra which designs to effect when dealing with numbers what the ancients achieved in the matter of figures These two methods he claims are nothing else than the spontaneous fruit sprung from the inborn principles of the discipline here in question

Descartes does not regard his success as consisting in the advance of mathematical truth through discoveries based upon principles or conclusions already established Nor would he even be satisfied to say that his use of algebra in developing analytical geometry created a new branch of mathematics Rather in his own view it tended to unify all existing branches and to form a single universal method of analysis In effect it revolutionized the whole character of mathematics and laid the foundation for the characteristically modern development of that science since his day To speak freely he writes I am convinced that it is a more powerful instrument of knowledge than any other that has been bequeathed to us by human agency as being the source of all others

One need not quite agree with Bertrand Russell that pure mathematics was not discovered until the 19th century in order to perceive that the discoveries made in that century carry out the spirit of the Cartesian revolution If one understands the difference between the universal mathematics of Descartes and the separate sciences of arithmetic and geometry as developed by the ancients if one understands the difference between the theory of equations in Descartes and the theory of proportions in Euclid if one understands how algebraic symbolism replacing numbers by letters frees both arithmetic and geometry from definite quantities then the profound discontinuity between modern and ancient mathematics begins to be discernible

There are other differences contributing to that discontinuity such as the modern treatment of the infinite the invention of the calculus and the theory of functions But what is of prime importance for the purpose of understanding the nature of mathematics its objects and its methods is the perception of the discontinuity in any one or another of its manifestations Here is a fundamental disagreement about the nature of mathematics which is not an issue between philosophers disputing the definition of the science but rather an issue made by the actual work of mathematicians in ancient and modern times

In his *Battle of the Books*—ancient and modern—Swift sees only the great poets and philosophers of the two epochs set against one

another The battle between the ancient and the modern books of mathematics might be as dramatically represented In such affairs there is a natural tendency to prejudge the issue in favor of the modern contender That prejudice has rea on on its side in certain fields of knowledge where the perfection of new instruments and the discovery of new facts work to the advantage of the latecomer But it is questionable whether in this dispute over the nature of mathematics the same advantage prevails

When the issue is fairly explored by an examination of the differences between the great masterpieces of ancient and modern mathematics it may be found impossible to say that truth lies more on one side than on the other or that one conception of mathematics is more fruitful than another because the two versions of the science may seem to be incommensurable in their aims methods and standards of accomplishment

ONE EXAMPLE WILL illustrate this incommensurability The ancient notion of number as may be seen in Nicomachus *Introduction to Arithmet c* limits the variety of numbers A number always numbers a number of things even though we can deal with the number itself apart from any set of numbered things It is always a positive and integral quantity which excepting unity itself the natural starting po nt of all numbers contains a multitude of discrete units

Numbers are classified according to the way in which they are constituted of parts and according to the constitution of these parts The primary divis on of numbers is into even and odd "The even is that which can be divided into two equal parts without a unit intervening in the middle and the odd is that which cannot be divided into two equal parts because of the aforesaid intervention of a unit

The even numbers are capable of subdivision into the even times even the odd times even and the even times odd and the odd into the prime and incomposite the secondary and composite and the number which in itself is secondary and composite but relatively is prime and incompo ite The peculiarit es of these types of number are expl ined in the chapter on QUANTITY There are still further classifications of numbers into superabundant deficient and perfect and of the parts of numbers in relation to the numbers of which they are parts

Finally numbers are considered in terms of their geometrical properties to be observed when their units are disposed discretely in spatial patterns and in one two or three dimensions There are linear plane and solid numbers and among plane numbers for example there are triangular square pentagonal hexagonal numbers and so on

The arithmetic operations of addition subtraction multiplication and division are performed in the production of numbers or in the resolution of numbers into their parts But though any two numbers can be added together or multiplied the inverse operations cannot always be performed A greater number cannot be subtracted from a less for subtraction consists in taking a part from the whole and leaving a positive remainder Since division is the decomposition of a number into its parts a number cannot be divided by one greater than itself for the greater cannot be a part of the less

In short in Nicomachus theory of numbers what later came to be treated as negative numbers and fractions can have no place Nicomachus will not carry out arithmetical operations in all possible directions without regard to the result obtained He refuses to perform these operations when the results which would be obtained do not have for him the requisite mathematical reality He does not find it repugnant to reason that subtraction and division unlike addition and multiplication are not poss ble for any two numbers as for example subtracting a larger from a smaller number or using a divisor which does not go into the dividend evenly and so leaves a fractional remainder On the contrary Nicomachus finds it repugnant to reason to perform these operations in violation of the r proper mean ng and to produce thereby results such as negative quantities and fra tions which are for him not numbers *i e* which cannot number any real thing

Understanding the nature of square numbers Nicomachus would be able to understand a square root but he would not see why the operation of extracting the square root should be

applied to numbers which are not square Hence another kind of modern number the irrational fraction which is generated by such operations as the extraction of the square of positive integers which are not perfect squares would never appear in Nicomachus set of numbers nor would the imaginary number which is the result of applying the same operation to negative quantities

When the arithmetical operations are performed algebraically with unknowns as well as definite quantities the solution of equations requires the employment of terms which Nicomachus would not admit to be numbers—negatives fractions (both rational and irrational) imaginaries and complex numbers which are partly real and partly imaginary Descartes finds nothing repugnant in these novel quantities On the contrary he would find it repugnant not to be able to perform the basic arithmetical operations without restriction Algebra would be impossible and with it the general method of analysis that proceeds in terms of the purely formal structure of equations from which all definite quantities have been excluded It would also be impossible to do what Descartes thinks essential to the unity of mathematics namely to represent geometrical operations algebraically and to perform most algebraic operations geometrically

Geometrical loci cannot be expressed by algebraic formulae or equations unless there are as many numbers as there are points on a line The number series for Nicomachus without fractions and irrationals is neither dense nor continuous There are fewer numbers than there are points on a line. And without the use of zero negative numbers and fractions—none of which would be regarded as numbers by Nicomachus—it would be impossible for Descartes to construct a set of coordinates for the geometrical representation of equations whereby all the points in a plane have their unique numerical equivalents

The Cartesian synthesis of algebra and geometry which in his view vastly increases the power of each violates the ancient distinction between continuous and discontinuous quantities—magnitudes (like lines and planes) and multitudes (or numbers) Euclid for example treats the irrational or the incommensurable always as a relation of magnitudes never of multitudes or numbers for him certain geometrical relationships cannot be expressed numerically Arithmetic and geometry are not even coordinate much less co-extensive sciences Arithmetic is the simpler the more elementary science and is presupposed by geometry

Other examples arising from the innovations of Descartes might be employed to show the chasm between the arithmetic and geometry of the ancients and modern mathematics—such as the treatment of infinite magnitudes and numbers the theory of functions and the method of the calculus But the multiplication of examples does not seem necessary to suggest that there may be no answer to the question Is Descartes right and Nicomachus and Euclid wrong? or to the question Are the modern innovations improvements or corruptions of the mathematical arts and sciences?

These questions are not like questions concerning the truth or falsity of a proposition in mathematics or the validity of a proof A given theorem in Euclid must in the light of his definitions axioms and postulates be either true or false and accordingly Euclid s demonstrations or constructions are either cogent or fallacious The same rules apply to Descartes But whether Euclid s or Descartes conception of the whole mathematical enterprise is right seems to present a choice between disparate worlds a choice to be made by reference to principles and purposes which are themselves not mathematical

Modern mathematics may be much more useful in its physical applications especially in the analysis and calculation of variable motions or quantities It may have a special elegance and simplicity as well as greater unity and even systematic rigor But it may also purchase these qualities at the expense of the kind of intelligibility which seems to characterize ancient mathematics as a result of the insistence that its objects have an immediately recognizable reality Ancient mathematics never occasioned such an extreme remark as that made by Bertrand Russell about modern mathematics—that it is the science in which we never know what we are talking about nor whether what we are saying is true

THE QUESTION OF the reality of the objects of mathematics is in part a problem for the mathematician and in part a question for the philosopher The problem for the mathematician seems to be one of establishing the existence of the objects he defines This can be illustrated by reference to Euclid s *Elements*

The basic principles as Euclid expounds the science seem to be threefold definitions postulates and axioms or common notions The axioms are called common notions because they are truths common to other branches of mathematics as well as to geometry The common notions are called axioms because their truth is supposed to be self evident. In contrast the postulates are peculiar to geometry for they are written as rules of construction. They demand that certain operations be *assumed* possible such as the drawing of a straight line or a circle or the transposition of a figure from one portion of space to another without alteration of its form or quantity

Euclid s definitions include the definition of a straight line and a circle His first two postulates therefore seem to ask us to assume that space is such that these defined geometrical objects exist in it as they are defined or in other words that objects corresponding to the definitions have geometrical reality But there are many definitions—of a triangle of an equilateral triangle of a parallelogram—for which Euclid states no postulate demanding that we assume the geometrical reality of the object defined Hence before he undertakes to demonstrate the properties of these figures, he finds it necessary to prove that they can be constructed Until they are constructed and the construction demonstrated the definitions state only po sib lities to which no geometrical realities are *known* to correspond in the space determined by Eucl d s postulates

In his first constructions Euclid can employ only the definition of the figure itself his axioms and those postulates which permit him to use certain mechanical devices—the straight edge and the compass wh ch are the mechanical equivalents of his postulates that a straight line can be drawn between any two points and a circle described with any radius from any point upon a plane When for example in the first proposition of Book I Euclid thus demonstrates the construction of an equilateral triangle he has proved the geometrical existence of that figure or in other words its reality in the space of his postulates

A number of questions can be asked about this and many other similar demonstrations The postulates being assumptions their truth can be questioned and an effort made to prove or disprove them This type of questioning led to the development of the non Euclidean geometries. After centuries of trying unsuccessfully to prove Euclid s postulate about parallel lines geometers like Lobachevski and Riemann postulated other conditions concerning parallels with consequences for the properties of other geometrical figures

The interior angles of a Euclidean triangle for example equal the sum of two right angles in certain non Euclidean triangles they add up to more or less than two rights One interpretation of this situation is that the truth of conclusions in geometry is entirely dependent on arbitrary assumptions Another is that the several variants of the parallel postulate indicate the selection of different spaces in which to construct figures and under each set of spatial conditions postulated there is only one body of geometrical truths concerning the properties of the figures therein constructed

Another type of question concerns the logical as opposed to the geometrical conditions of geometrical proof In his essay *On Geometrical Demonstration* Pascal declares the geometric method to be the most perfect available to men for it consists not in defining or in proving everything nor in defining or proving nothing but in maintaining itself in the middleground of not defining things which are clear to all men and in defining all others and not proving everything known to men but in proving all the other things This method it seems is not restricted to the subject matter of geometry to Descartes and Spinoza at least it seems to be the method for demonstrating any theoretical truth Descartes presents arguments demonstrating the existence of God and the distinction between soul and body drawn up in geometrical fashion and as its title page indicates the whole of Spinoza s *Ethics* is set forth in geometrical order

It may be questioned wh

which Descartes adds to his definitions and axioms or those which Spinoza introduces beginning with Proposition 13 of Book II function as postulates do in geometry i e as rules of construction it may similarly be questioned whether Spinoza is following the geometrical method in Book I where he proceeds without any postulates at all But the more general question concerns the criteria for testing the consistency and the adequacy of the primitive propositions—the definitions axioms postulates—laid down as the foundation for all that is to be demonstrated The investigation of this problem calls for an examination of the whole process of proof from which has developed the modern theory of mathematical logic that challenges the universality and adequacy of the *traditional logic of Aristotle* and asserts that mathematics and logic are continuous with one *another—essentially the same discipline*

The issues raised by mathematical logic or the logic of mathematics are considered in the chapters on Hypothesis Logic and Reasoning Here we must turn finally to one other question which is of interest principally to the philosopher rather than the mathematician It concerns the objects of mathematics It is a question about their reality or mode of existence which cannot be answered by the mathematical proof of a construction

When for example Euclid constructs an equilateral triangle the figure established cannot be the one imperfectly drawn upon paper *The postulated permission to use a ruler and* compass does not remove the imperfection of these mechanical instruments or the *inaccuracy* in their physical use The triangle whose properties the geometer tries to demonstrate must be perfect as no actually drawn figure can be The philosophical question therefore concerns the reality or existence of this ideal perfect figure The same question can be asked about pure numbers—numbers apart from all numbered things

Are the objects of mathematics purely intelligible beings existing apart from the sensible world of material things? *Or are they ideal entities*—not in the sense of existing outside the mind but in the sense of being ideas in the mind itself rather than perceptible particulars? As indicated in the chapters on Being Form and Idea Plato and Aristotle seem to answer these questions differently But there are further differences among those who regard mathematical objects as having being only in the mind

Aristotle Aquinas Locke and James for example think of the objects of mathematics as universals formed by abstraction from the particulars of sense and imagination The mathematicals such as numbers and figures Aquinas writes do not subsist as separate beings Apart from numbered things and physical configurations numbers and figures have a separate existence only in the reason in so far as they are abstracted from motion and matter Hobbes Berkeley and Hume on the other hand deny abstract ideas or universal concepts Let any man try to conceive a triangle in general Hume declares which is neither *isosceles* nor *scalenum* nor has any particular length or proportion of sides and he will soon perceive the absurdity of all the scholastic notions with regard to abstraction and general ideas

Despite these differences there seems to be general agreement in the tradition of the great books that the truths of mathematics are rational rather than empirical or in the language of Kant and James *a priori* rather than *a posteriori* But the meaning of this agreement is not the same for those who think that truth in mathematics does not differ from truth in other sciences and those who think that mathe*matical truths stand alone precisely because* they are not about matters of fact or real existence

Plato for whom all science is knowledge of purely intelligible objects regards the mathematical sciences as inferior to dialectic in the knowledge of such objects because they start from hypotheses and do not ascend to principles The students of such sciences Plato writes assume the odd and the even and the figures and three kinds of angles and the like in their several branches of science these are their hypotheses which they and everybody are supposed to know and therefore they do *not deign to give any account* of them either to themselves or others but they begin with them and go on until they arrive at last and in a consistent manner at their conclusion

For Aristotle what differentiates mathe matics from physics and metaphysics is the special character of its objects Physics and metaphysics both deal with substances as they exist outside the mind whereas the objects of mathematics are abstractions Though figures and numbers are inseparable in fact from material substances they are separable from any particular kind of body by an effort of abstraction This does not deny for example that physical things have perceptible figures It merely insists that the geometer does not treat figures *as* sensible but *as* intelligible that is as abstracted from matter Nevertheless the truths of mathematics no less than those of physics and metaphysics apply to reality All three sciences are further alike in demonstrat in their conclusions rationally rather than by experiment All three employ induction to ob tain their principles though metaphysics alone attains to the first principles of all science

For Kant mathematical cognition is cogni tion by means of the *construction* of concep tions To explain this he cites the example of the construction of a triangle I construct a triangle by the presentation of the object which corresponds to this conception either by mere imagination (in pure intuition) or upon paper (in empirical intuition) in both cases completely *a priori* without borrowing the type of that figure from any experience We keep our eye merely on the act of the con struction of the conception and pay no atten tion to the various modes of determining it for example its size the length of its sides the size of its angles The *a priori* character of such in tuitions on which rests the *a pr o i* character of mathematical truths does not mean that math ematics has no relevance to experience Arith metic and geometry are like physics according to Kant they are sciences of experience or nature but like pure (as opposed to empirical) physics they are *a pr o i* sciences Since Kant holds that experience itself is constituted by *a prior* forms of perception he can ascribe the validity which mathematics has for all possible experience to the *a priori* intuition of the pure forms of phenomena—space and time

Bertrand Russell rejects this Kantian view which [asserts] that mathematical reasoning is not strictly formal but always uses intuitions *i e* the *a priori* knowledge of space and time Thanks to the progress of Symbolic Logic this part of the Kantian philosophy Russell holds is now capable of a final and irrevocable refutation. Leibnitz before Kant had advo cated the general doctrine that all mathemat ics is a deduction from logical principles but according to Russell he had failed to substanti ate this insight partly because of his belief in the logical necessity of Euclidean geometry The same belief is in Russell s opinion the cause of Kant s error The actual propositions of Euclid do not follow from the principles of logic alone and the perception of this fact he thinks led Kant to his innovations in the theory of knowledge But since the growth of non Euclidean geometry it has appeared that pure mathematics has no concern with the question whether the axioms and propositions of Euclid hold of actual space or not

Russell asserts that by the help of ten prin ciples of deduction and ten other premises of a general logical nature (*e g* implication is a relation) all mathematics can be strictly and formally deduced He regards the fact that all Mathematics is Symbolic Logic as one of the greatest discoveries of our age and when this fact has been established the remainder of the principles of Mathematics consists in the analysis of Symbolic Logic itself Though this view of mathematics may not be worked out in detail except in such treatises as Russell s *Principles of Mathemat cs* and in the *Principia Mathematica* on which he collaborated with Whitehead the conception of mathematics as a purely formal science analogous to (if not identical with) logic does have some anticipa tions in the great books For James as for Locke and Hume mathematics is strictly a science of the relations between ideas not of real existences As regards mathematical judg ments James writes they are all rational propositions for they express results of com parison and nothing more The mathemat cal sciences deal with similarities and equalities ex clusively and not with coexistences and se quences Both James and Locke however differ from Hume in thinking that there are sciences other than those of number and quan tity which can demonstrate their conclusions with certitude

The foregoing discussion indicates *some* of the differences among philosophers concerning the objects of mathematics the conditions of *its truth and its relation to other sciences* These disagreements do not seem to take the form of an opposition between ancient and modern thought like that between ancient and modern mathematicians concerning the nature of their science The two oppositions do not run parallel to one another

On the contrary the objections which modern philosophers especially Berkeley Hume and Kant raise against the notion of infinite quantities seem to favor the ancient rather than *the modern tenor of mathematical thought* Though the reasons they give do not derive from the same principles as those to which Plato and Aristotle appeal they like the ancients appear to insist upon a certain type of intelligibility in the objects of mathematics which seems to have been sacrificed in the mathematical development initiated by Descartes

PAGE SECTIONS When the text is printed in on column th letters a and b refer to the upper and lower halves of th page For example in **53** JA IES *Psychology* **116a 119b** the passage be ins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand s de of the page For example in **7** PLATO *Symp sium* **163b-164c** the passage beg ns in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

AUTHOR S DIVISIONS One or more of the *main divisions* of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in cer tain cases *e g* *Il ad* BK II [265 83] **12d**

B BLE REFERENCES The references are to book chapter and verse When the King James and Douay versions differ *in title of books or in the numbering of chapters or verses* the King James version is cited first and the Douay indicated by a *(D)* follows *e g* OLD TESTA MENT *Nehem ah* 45—*(D) II Esdras* 7 46

SYMBOLS The abbreviation esp calls the reade s attention to one or more especially relevant parts of a whole reference *passim* s gnifies that the *topic is discussed inte mit* tently rather than continuously in the work or passage cited

For additional information concerning the style of the ref rences see the Explanation of Reference St le for general guidance in the use of *The G eat Ideas* consult the Preface

Chapter 53 MATTER

INTRODUCTION

AFTER we came out of the church says Boswell in his *Life of Johnson* we stood talking for some time together of Bishop Berkeley s ingenious sophistry to prove the non existence of matter and that every thing in the universe is merely ideal I observed that though we are satisfied his doctrine is not true it is impossible to refute it I shall never forget the alacrity with which Johnson answered striking *his foot* with mighty force against a large stone till he rebounded from it I refute it thus

But Berkeley s argument anticipated Dr Johnson s style of refutation I do not argue he says against the existence of any one thing that we can apprehend either by sense or reflexion That the things I see with my eyes and touch with my hands do exist really exist I make not the least question The only thing whose existence I deny is that which *philosophers* call Matter or corporeal substance And in doing this there is no damage done to the rest of mankind who I dare say will never miss it

The rest of mankind does need to be instructed however that when they use the word matter they speak of *nothing* They may from careless habit suppose they are referring to the most obvious something there is in the world—the solid massy concrete stuff of which tangible visible movable and moving things are made Of them Berkeley would ask how they know such stuff exists It is not itself perceptible

We perceive a variety of qualities—colors shapes temperatures textures sizes or extensions—but these Berkeley argues have their being *in being perceived* Even if certain of these sensible qualities sometimes called primary such as figure size or weight are supposed to belong to bodies when they are not actually being sensed they are not matter but only its properties Matter itself is not sensible Those who assert its existence postulate it as a substratum or support for the sensible qualities they perceive

The question therefore is whether such a substratum is a necessary or an unnecessary hypothesis Berkeley does not deny the existence of beings which cannot be directly sensed He affirms the existence of the human spirit or mind of minds other than his own and the spiritual being of God These must be inferred to exist in order to explain the phenomena of our sensible experience and the experience of our own activities in thinking imagining willing If in addition the existence of matter or a material substance were necessary to explain the phenomena Berkeley would not object to affirming its existence by inference even if it could in no way be directly perceived

His argument *therefore involves first* a denial of Locke s distinction between primary and secondary qualities Supposing it to be generally agreed that colors sounds odors have no actual existence except in the perceiving mind he denies that perceptible figure size or motion can exist otherwise It having been shown that none even of these can possibly exist otherwise than in a Spirit or Mind which perceives them it follows that we have no longer any reason to suppose the being of Matter

Matter is not needed as a substratum or support for the qualities we perceive This is the second main point in Berkeley s argument 'Though we give the materialists their external bodies they by their own confession are never the nearer knowing how our ideas are produced since they own themselves unable to comprehend in what manner body can act upon spirit or how it is *possible it should imprint any idea* in the mind Hence it is evident that the production of ideas or sensations in our minds can be no reason why we should suppose Matter or

corporeal substances since that I acknowledged to remain equally inexplicable with or without this supposition

Berkeley's arguments against matter which occupy the greater part of his *Principles of Human Knowledge* may not have the same force when they are applied against different theories of matter Berkeley seems to regard his attack on materialism as the refutation of an error at the root of skepticism atheism and irreligion He also thinks materialism creates difficulties for the sciences But are all affirmations of matter to be lumped together as materialism *in the same sense*? Are Aristotle Plotinus Descartes Spinoza and Locke materialists in the same sense as Lucretius Hobbes and perhaps Marx? Does it make no difference whether bodies are said to be the only real existences or whether in addition to bodies immaterial substances or spiritual beings are also said to exist?

Does it make no difference how matter is conceived—whether as a self subsistent substance in its own right capable of existing apart from any qualities except extension and motion which belong to its very essence or merely as one factor in the constitution of bodies the factor of potentiality which as will be presently explained has no existence apart from the forms which actualize it? Are skepticism atheism and irreligion to be associated with all affirmations of matter in view of the fact that theologians like Augustine and Aquinas seem to think that a sound view of matter supports the truths of religion against the errors of the materialists?

There seem to be in short three distinct positions to which Berkeley's blanket denial of matter stands opposed The diametrically opposite view seems to be the blanket denial of anything except bodies or of anything which cannot be reduced to a property or function of matter The atomism of Lucretius discussed in the chapter on Element may be taken as representative of this view though Engels would insist that materialism can be dialectical rather than atomistic or mechanical

Between the two extremes there appear to be two middle positions which are alike insofar as both affirm the immaterial as well as the material Although they are alike in asserting the existence of spiritual substances they may of course define the nature of these immaterial things differently and differently interpret their relation to the realm of matter But as theories of matter their principal difference consists in the way in which they conceive the being of bodies material substances or the bodily mode of substance

In the conceptions of Descartes and Locke for example it is matter which gives actuality to sensible bodies We have no other idea or notion of matter Locke writes but something wherein those many sensible qualities which affect our sense do subsist The entire substance of sensible bodies consists of matter *All their properties derive from the essence or* nature of matter But in the conceptions of Aristotle and Plotinus bodies would not exist at all if they were composed only of matter for matter is no more than a capacity for being not something which by itself actually is Sensible bodies derive their being and all their attributes from the forms which matter assumes when its potentialities are actualized Matter totally devoid of form is not the *nothing* Berkeley calls it but it is so near to nothing that Plotinus says it is more plausibly called a non being a bare aspiration towards substantial existence

These theories of matter or corporeal being seem to be as contrary to one another as together they are contrary to Berkeley's doctrine Yet each of the two middle positions leans toward one of the opposite extremes

The conception of matter seems to be very much the same in the complete materialism of Lucretius and Hobbes and in the view of Descartes Spinoza and Locke In the former only bodies exist In the latter bodies do not comprise the whole of existence but matter is the whole substance of bodies The separation of body and mind or matter and spirit into distinct substances or modes of substance leaves matter the same kind of stuff that it is in a world which admits of no other reality Atomism furthermore may be common to both theories at least to the extent that it is *held* that the complex bodies we perceive are composed of minute and insensible particles. Unlike Lucretius Locke may not insist upon the absolute indivisibility of the particles or upon the eternity of the uncreated atoms of matter

but he like Hobbes and Newton carries the division of the familiar bodies of sense expe rience down to parts which cannot be perceived and yet have in a way a more ultimate reality as units of matter than the complex bodies they constitute

Had we senses acute enough to discern the minute particles of bodies and the real con stitution on which their sensible qualities de- pend Locke writes I doubt not but that would produce quite different ideas in us and that which is now the yellow color of gold would then disappear and instead of it we should see an admirable texture of parts of a certain size and figure

At the other extreme Berkeley s complete denial of matter has less in common with the view of Aristotle Plotinus Augustine and Aqui nas than the theory of Descartes Spinoza and Locke has with the materialism of Lucretius and Hobbes They would appear to be close enough for one seems to hold that matter is almost non being and the other that matter is simply nothing at all But where Berkeley de nies any role to matter Aristotle and those who take his view affirm matter to be an indispen sable factor in the constitution of physical things They do not question the reality of bod ies or their existence apart from mind On both of these points they are as opposed to Berke- ley as they would be if they were complete materialists Nevertheless they lean toward Berkeley rather than toward the other extreme in one respect Where Berkeley denies the existence of matter they deny its substantiality Where Berkeley says matter has no being they say it has the lowest grade of being—on the very verge of not being!

IN SPITE OF ALL the differences noted the idea of matter has a certain constant meaning throughout the tradition of the great books

It is generally associated with the idea of quantity and especially the basic magnitudes such as time space and mass Sometimes it is said that the essence of matter itself is exten sion sometimes that bodies—not matter itself —have the property of trid mensionality But in either case that which *is* or *has* matter in it necessarily occupies space

The manner of that occupation is also gener ally agreed upon Two bodies or two distinct quantities of matter cannot occupy the same place at the same time A body may not be im penetrable in the sense of being indivisible but so long as it remains the whole that it is it offers resistance to other bodies tending to move into the place it occupies

There is another connection between matter and quantity To those who ask what makes two otherwise identical things two in number—or what is involved in the merely numerical dif ference of things alike in every other respect— the usual answer is in terms of matter Matter is traditionally spoken of as the principle of in dividuation Aquinas for example holds that angels unlike physical substances cannot differ from one another as do numerically distinct in dividuals Because they are immaterial they can differ only as do species or kinds Such things as agree in species he writes but differ in number agree in form but are distinguished materially If therefore the angels be not com posed of matter and form it follows that it is impossible for two angels to be of one species just as it would be impossible for there to be several whitenesses apart or several humanities since whitenesses are not several except in so far as they are in several substances

The way in which matter is related to in dividual differences can be exemplified in works of art Two coins stamped out of the same kind of matter by the impression of the same die may differ in no other discernible respect than that they are *two* of the same kind Their *twoness* seems to be somehow related to the fact that each consists of a distinct quantity of mat ter But it may be asked how two units of mat ter have the distinction of being two while they differ in no other respect One answer to this difficult question is that their distinction con sists in their occupying different places In the Platonic theory of the origin of many particu lars all participating in the same form diversity of place seems to play the role which matter plays for Aristotle and Aquinas

Plato s doctrine of the receptacle which is discussed in the chapter on FORM is sometimes interpreted by conceiving the receptacle as space and sometimes by conceiving it as mat ter The receptacle it is said in the *Timaeus* is that which while receiving all things never

departs at all from her own nature and never in any way or at any time assumes a form like that of any of the things which enter into her This according to Plotinus means that its one form is an invincible formlessness

But Plotinus who combines Plato s doctrine of the receptacle and the forms with Aristotle s theory of potentiality and actuality holds that it is matter not space which is the receptacle and nurse of all generation He says that recipient and nurse is a better description of matter than the term mother for that term is used by those who think of a mother as matter to the offspring as a container only giving nothing to them In his own view matter is more than space or mere receptivity He is willing to admit the parallel with motherhood only to the extent that matter is sterile not female to full effect female in receptivity only not in pregnancy

TRADITIONALLY *the distinction between universal and particular is understood as a distinction between the intelligible and the sensible* This indicates another traditional meaning of matter or the material The realm of sensible things is the realm of bodies But the atoms which are the elementary bodies are also usually called insensible particles of matter This however can be interpreted to mean not that a definite material mass or bulk is in itself absolutely *intangible* or *imponderable* but that because of the limitation in our senses it is imperceptible to us On this interpretation it would then seem possible to say that *all* bodily existence is sensible existence

But if we ask about the sensibility of matter itself rather than of bodies large or small questions arise which are more difficult to solve On one theory of matter matter devoid of form is as insensible as it is unintelligible yet forms which are not material that is not in matter are also insensible but not unintelligible On the contrary they are regarded as more perfectly intelligible than embodied forms How then does matter which is itself insensible cause the forms which it assumes to become sensible when they are materialized?

The theory of matter which does not regard it as a co-principle with form seems to be confronted with a different problem of sensibility It is supposed that some of the qualities which we sense in bodies are actually in them whether we sense them or not—such properties as size figure weight motion Other sensible qualities such as colors odors temperatures or sounds are supposed to be effects produced by the motions of material particles acting on the sensitive apparatus of animals This distinction between what Locke calls primary and secondary qualities —found also in Lucretius and Descartes—is more fully considered in the chapters on QUALITY and SENSE but here it calls attention to the problem of how matter devoid of certain sensible qualities causes these qualities to arise

For Lucretius the peculiar difficulty of the problem seems to lie in the fact that the sensitive animal is itself nothing but a material system All its powers and acts are conceived as functions of matter in motion How then does moving matter within the organism generate certain qualities which do not belong to moving *matter outside the organism? For Locke the* problem raises a difficulty of still another sort Secondary qualities such as colors sounds odors exist only as sensations in the mind In corporeal substances or bodies such qualities he writes are nothing but the powers those substances have to produce several ideas in us by our senses which ideas are not in the things themselves otherwise than as anything is in its cause Though they result from the impact of moving particles on the bodily sense organs they do not belong to the world of matter at all, but to the realm of spirit How then do the motion of matter cause effects which exist only in the immaterial domain of mind?

These questions indicate some of the problems of matter as an object condition or cause *of knowledge They also show how the nature* of the problem varies with different conceptions of matter both in itself and in its relation to mind There are still other problems which confront those theories of mind which separate reason or intellect from the sensitive faculty

In such theories the consideration of matter s relation to mind goes beyond the question of the origin of sensations It takes sensations and images as somehow the functions of living matter—the acts of the various sense-organs and the brain But sensations and images because they are acts of corporeal organs have the

same limitation which belongs to everything material As matter is said to cause the individ uality or numerical diversity of bodies so is it said to make sensations and images particular intentions of the mind —that is capable of representing only particular objects not gener al kinds or classes Hence such theories face the problem of the relation of sensations and images to the universal intentions of the mind its general concepts or abstract ideas

ONE MORE TRADITIONAL meaning of matter re mains to be mentioned The sciences of physics or mechanics are concerned with change or mo tion They are not concerned with mutability in general but with the kind of mutability that is manifested by material things Material things are never conceived as unmovable or un changeable

The question whether matter itself is immu table has different meanings for different theories of matter On the theory (discussed in the chapter on CHANGE) that matter and form are together principles of change in changing sub-stances it is neither matter nor form but the substance composite of matter and form which changes Those who think that the motions of the physical world are without beginning and end attribute a similar eternity to matter and conceive it as imperishable The theologians who think that God can annihilate whatever He creates do not hold that matter is indestruct ible but they nevertheless attribute everlast ing endurance to matter in God s plan Aquinas for example in his treatise on the end of the world describes the final conflagration which will purge the material universe but leave its matter in existence under the forms of the ele-ments and the heavenly bodies The world will be renewed he writes in such a way as to throw off all corruption and remain forever at rest Hence nothing can be the subject of that renewal unless it be a subject of incorrup tion such as the heavenly bodies the ele-ments and man

On other theories of matter the fact that mo-tion is regarded as an intrinsic property of bod ies seems to be similarly consistent with the notion that matter itself is immutable or inde-structible This indestructibility may be con ceived in terms of the absolute indivisibil ty of the atoms as in Lucretius and Newton or as in Spinoza it may be established by the uncreated and eternal nature of God By body Spinoza writes I understand a mode which expresses in a certain and determinate manner the essence of God in so far as He is considered as the thing extended

In the modern development of the science of mechanics the law of the conservation of mat ter seems to be another expression of the same insight We may lay it down as an incontest able axiom Lavoisier writes that in all the operations of art and nature nothing is created an equal quantity of matter exists both before and after the experiment What appears to be the destruction of a body is merely the trans formation of its matter into another physical condition without loss of mass unles there is an equivalent gain in energy The total quantity of matter and energy remains constant through out all physical changes

But though change or motion seems to be in herent in the material world the mutability of bodies as well as the immutability of matter seems to be differently conceived according to different conceptions of matter The difference between the physics of Aristotle and the phys ics of Descartes can be expressed in terms of contrary definitions of motion or divergent notions of causality but neither of these differ ences is fully intelligible apart from the vari ance of these theories from one another on the nature of matter

When matter is an actual substance whose es sence is extension and whose chief property is local motion the principles of physics are me chanical The laws of mechanics with time space and mass as their fundamental variables seem to have a universality adequate for de-scribing all natural phenomena All changes in material things are either the local motions of bodies or the result of the local motions of their parts Motions are determined in their magni tude and direction by the impressed force which one body exerts upon another and the resistance of that other Mot on is itself completely ac tual as matter is and the only type of cause to which physics need appeal is the efficient cause that is the pu h or pull of one body upon another

Physicists who share this conception of mat

ter may not agree as Descartes and Newton do not in their mechanical formulations They may or may not be atomists They may like Lucretius think that local motion is an absolutely intrinsic property of the eternal particles or like Descartes and Newton they may think that God first imparted motion to matter at the world s creation They may hold that all subsequent motions issue therefrom in a continuous chain of cause and effect But when matter is the only factor in the constitution of bodies and one body differs from another only in its quantitative determinations the consequence for physical theory seems to be one or another sort of mechanical formulation

When matter is nothing more than a body s potentiality for change and when neither what the body is nor how it changes can be explained by reference to its matter alone physical theory seems to be constructed in other than mechanical terms Its concepts and principles resemble those of biology It finds natural tendencies or desires and ends or final causes in the motion of inert as well as animate bodies

Central to Aristotle s physics are his theory of the four causes discussed in the chapter on CAUSE and his theory of the four types of change discussed in the chapter on CHANGE But even more fundamental is his definition of motion as the actualization of that which is potential in a respect in which it is potential With motion so defined the principles of physics must include the correlative factors of potentiality and actuality which Aristotle conceives in terms of matter and form

REMOVE MATTER entirely from a thing and according to Aristotle you remove its capacity for physical change Remove form and you remove its existence for nothing can exist without being actual or determinate in certain respects *When a thing changes physically it* loses certain determinate characteristics and acquires others The determinations it acquires it had previously lacked yet all the while it must have had a capacity for acquiring them The thing is capable both of being and of not being Aristotle says and this capacity he goes on to say is the matter in each The matter of an existing substance is thus conceived as that which has certain forms (the respects in which the substance is actually determinate) and lacks certain forms which it can assume (the respects in which the substance is both indeterminate and potential)

As the chapter on ART indicates Aristotle frequently uses artistic production to afford a simple illustration of his theory of matter and form as principles of change When a man sets out to make a bed he chooses material such as wood which can be shaped in a certain way The same wood could have been made into a chair or a table With respect to these various possible determinations in structure the wood is itself indeterminate and determinable

Before the artist has worked on it productively the wood is in a state of both privation and potentiality with regard to the form of a bed a chair or a table The transformation which the artist effects consists in his actualizing certain potentialities in the material for forms or determinations which the material at the moment lacks When the bed is made the wood or matter which is now actually in the form of a bed may still have the potentiality for being *remade* into a chair or table

The wood of course remains actually wood throughout these artificial changes as it does not when it suffers the natural change of combustion This indicates that though the wood may be called matter or material by the artist it is not matter but a substance a thin composite of matter and form for when the wood is reduced to ashes by fire the matter which had the form of wood assumes another form

In the analysis of accidental change which artistic production illustrates it suffices to treat a composite substance like wood or iron or bronze as the material principle But in the analysis of substantial change when matter itself changes from being one kind of matter to being another in the coming to be or perishing *of composite substances the material principle* must be pure matter—matter totally devoid of form Where a whole substance can be regarded as the matter or substratum of accidental change (in quality quantity or place) the substratum of substantial change which Aristotle calls generation and corruption must be matter in a condition of absolute indeterminacy and pure potentiality

Referring to this ultimate substratum as the

underlying nature Aristotle says that it is an object of scientific knowledge by analogy For as the bronze is to the statue the wood to the bed so is the matter and the formless before receiving form to anything which has form and so also is the underlying nature to substance *i e* the actually existing

ARISTOTLE S DEFINITION of matter as the primary substratum of each thing from which it comes to be without qualification and which persists in the result not only signifies an object which the physicist must apprehend analogically (*i e* by comparison with substantially formed matter like wood and bronze) but also indicates that matter by definition must be in itself both unintelligible and non existent What Aristotle calls the primary substratum is later called by Plotinus primal matter by Augustine formless matter and by Aquinas prime matter Since they all agree that that which is without form lacks all determination and actuality they deny that it can have existence by itself or be an object of knowledge either by sense or reason.

Augustine and Aquinas go further They deny even to God s omnipotence the power of creating matter without form They speak of matter not as created but as *concreated* that is united at the very instant of its creation with the forms it must assume in order to exist God made formless matter of absolutely nothing and the form of the world from this formless matter Augustine writes Yet He created both simultaneously so that form came upon matter with no space of time intervening

IN THE TRADITION of Aristotle s physics and metaphysics especially as developed by Aquinas matter and form become basic analytic terms often having a significance remote from their original meaning in the analysis of change The conception of prime (or formless) matter as the substratum of substantial change leads to the designat on of the formed matter underlying accidental change as second matter This in turn is called signate matter when considered as the matter of an ind vidual substance it is viewed as having the limiting determinations of indiv duality

Matter is twofold Aquinas writes common and signate or individual common such as flesh and bones and individual as this flesh and these bones When the intellect forms concepts of different kinds of physical substances, it abstracts from the individual sensible matter but not from the common sensible matter In defining the nature of man for example we abstract Aquinas says from this flesh and these bones which do not belong to the species as such but to the individual but we do not abstract from the fact that man consisting of body and soul is a thing of flesh and bones

To say that man consists of body and soul is to indicate that common matter enters into the definition of man as a physical substance But in distinction from definitions of this type which are proper to physics mathematical and metaphysical definitions carry the abstraction from matter still further In mathematics Aquinas declares the intellect abstracts not only from individual sensible matter but also from common sensible matter In conceiving numbers and figures the intellect does not however abstract from matter entirely but only from individual intellig ble matter The common intelligible matter which is represented by substance as subject to quantity underlies all mathematical notions But some things Aquinas maintains can be abstracted even from common intelligible matter such as *being unity potency act* and the like all of which can exist without matter Such abstraction characterizes the concepts of metaphysics Aquinas thus differentiates the three speculative sciences of physics mathematics and metaphysics in terms of three grades of abstraction each distinguished by the type of matter from which the concepts of the science are abstracted

With one exception physical matter is not said to be of d fferent kinds when it exists under different forms The one exception for both Aristotle and Aquinas is the matter of terrestrial and celestial bod es

Basing his inference on the observations available to him Aristotle holds that the heavenly bodies are eternal— not subject to increase or diminution but unaging and unalterable and unmodified Immutable in every other way they a e however subject to local motion Since they are eternal both their matter and

their motion must be different from that of perishable terrestrial bodies All things that change have matter Aristotle writes but matter of different sorts of eternal things those which are not generable but are movable in space have matter—not matter for generation however but for motion from one place to another That motion from place to place is unlike terrestrial motion circular it has the appropriate characteristic of endl ssness

Kepler challenges this theory of a radical difference between celestial and terrestrial matter or motion and as the chapter on ASTRONOMY shows by so doing he not only gives impetus to the Copernican system but also paves the way for Newton to frame laws of motion applicable to matter everywhere in the universe Because their matter is the same it is possible Kepler insists to explain the motion of the heavenly bodies by the same principles which account for the motion of bodies on earth

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to For example n 4 HOMER *Iliad* BK II [265 283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12

PAGE SECTIONS When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

AUTHOR S DIVISIONS One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases e g *Iliad* BK II [265 283] 12d

BIBLE REFERENCES The references are to book chapter and verse When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e g OLD TESTAMENT *Nehemiah* 7 45—(D) *II Esdras* 7 46

SYMBOLS The abbreviation esp calls the reader s attention to one or more especially relevant parts of a whole reference passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited

Chapter 54 MECHANICS

INTRODUCTION

MECHANICS taken as the name for just one of the physical sciences would merit no place on a small list of basic focal terms But the word mechanics means more than that In the tradition of western thought it signifies a whole philosophy of nature and it connotes a set of fundamental principles under which it has been thought all the physical sciences can be unified

The principles of mechanics have been applied not only in statics and dynamics which are concerned with the action and reaction of bodies at rest or in motion but also in acoustics and optics and the sciences of heat magnetism and electricity They have been extended to astronomical phenomena to constitute what is called celestial mechanics They have been thought to govern the action or motion of invisible particles or waves as well as the familiar bodies of ordinary experience In the range and variety of the phenomena it covers mechanics would *seem to be co extensive with physics* Such at least appears to be its scope at one stage in the development of natural science

We shall pre ently consider the dissatisfaction with the mechanical point of view which causes scientists in our own day to hail the replacement of classical mechanics by the new physics as a great advance in science The intellectual significance of this change can be compared with that earlier revolution in the 17th century when the new natural science founded on the achievements of Galileo Huygens and Newton replaced the physics of Aristotle which had long reigned as the traditional philosophy of nature What Einstein calls the rise and decline of the mechanical point of view thus seems to provide an apt title for the story of three stages in the history of science in only one of which does the whole of physics appear to be dominated by *mechanics*

One way then of understanding the importance of mechanics is in terms of that story Other chapters such as ASTRONOMY CHANGE ELEMENT MATTER PHYSICS SPACE and TIME —and perhaps also CAUSE and HYPOTHESIS— tell part of that story especially the part which turns on the differences between Aristotle s physics (which is neither experimental nor mathematical) and modern physics (which is both) This chapter focuses on issues which fall largely within modern physics—issues belonging to that part of the story which in the great books begins with *Galileo* Huygens and Newton and runs to Fourier and Faraday The story itself does not end there but the point to which Faraday carries it suggests the sequel in Clerk Maxwell and Einstein just as Galileo s point of departure reflects antecedents in Aristotle The great books state the issues sufficiently well though they do not tell the whole story That can be fully documented only by a host of supplementary *scientific classics in* various fields such as the works listed in the Additional Readings

IN MODERN TIMES it is accepted that physics should be both experimental and mathematical No one questions the ideal of unifying the physical sciences and finding the unity in nature s laws But the question is whether that unification can be achieved under the aegis of mechanics and the issue is whether physics should gather its experimental findings together under purely mathematical formulations or should also try to give those mathematical formulae a mechanical interpretation

The issue involves more than a question of scientific method It concerns the ultimate aim of natural science and the kind of concepts it should employ to fulfill this aim Should the *scientist seek to do no more than describe the*

phenomena of nature in terms of the simplest and most universal mathematical relations? Or should he go beyond description to an explanation of the phenomena in terms of their causes?

When the issue is thus stated as a choice between being content with description or striving for explanation it appears to be broader than the question whether physics should or should not be mechanical Even granted that explanation is desirable does it necessarily follow that physical explanation must employ the principles and concepts of mechanics? Aristotle s physics it can be argued provides a negative answer His various physical treatises represent a natural science which tries to explain the phenomena without doing so mechanically just as it tries to describe the phenomena without doing so mathematically

That the connection of these two features of Aristotle s physics is not accidental seems to be indicated by the conjunction of their opposites in modern physics When in the 17th century the physicist describes natural phenomena in mathematical terms he explains them—if he tries to explain them at all—in mechanical terms The laws of Mechanics writes Descartes are the laws of Nature Huygens opens his *Treatise on Light* by referring to optics as the kind of science in which Geometry is applied to matter but he at once expresses the desire to advance this branch of mathematical physics by investigating the origin and the causes of the truths already known in order to provide better and more satisfactory explanations Such explanations he thinks will be found only if we conceive the causes of all natural effects in terms of mechanical motions He declares it his opinion that we must necessarily do this or else renounce all hopes of ever comprehending anything in Physics

Galileo and Newton as will be noted do not unqualifiedly share Huygens view that it is proper for the mathematical physicist to inquire about causes But they would agree that if any explanation is to be given for laws of nature expressed in mathematical form one or another type of mechanical hypothesis would be required to state the causes Postponing for the moment the cons deration of whether the investigation of causes belongs to mathematical physics let us examine what is involved in giving a mechanical explanation of anything and why this type of explanation tends to occur in the causal interpretation of mathematically formulated laws of nature

Two points seem to constitute the essence of mechanical theory Both are fundamental notions and both are philo ophical in the sense that they do not seem to result from the findings of experimental research The first point is an exclusive emphasis upon efficient causes which means the exclusion of other types of causes especially final and formal causes from mechanical explanation As the chapter on CAUSE indicates efficient causality consists in *one thing acting on another* But not every sort of action by which one thing affects another is mechanical According to the doctrine an efficient cause is mechanical only if it consists in a moving body acting on another by impact or if it consists in a force exerted by one body to cause motion in another or to change its quantity or direction The notion of a force which does not work through the impact of one moving thing upon another raises the problem of action at a distance to which we shall return subsequently

The second fundamental point is an exclusive emphasis upon quantities Mechanical explanation makes no references to qualities or other attributes of things Paradoxically this point is sometimes expressed in terms of a distinction between primary and secondary *qualities* but as the chapters on QUANTITY and QUALITY point out the primary qualities are all quantities According to Locke they are solidity extension figure motion or rest and number according to Newton the universal qualities of all bodies whatsoever are extension hardness impenetrability mobility and inertia Others like Galileo and Descartes give still different enumerations but the point remains that the only attributes of bodies which have mechanical significance are measurable quantities Such secondary qualities for example as colors and tones belong to the physical world (as it is mechanically conceived) only by reduction to the local mot on of particles or waves having certain velocities lengths or other quantitative attributes

We need not be concerned here with what sort of reality is assigned to secondary qualities or how their presence in experience is accounted for These problems are discussed in other chapters such as QUALITY and SENSE However they are solved the philosophy of mechanism excludes from the physical world whatever does not consist in or cannot be reduced to quantities of matter (or mass) motion or force and such related quantities as those of time and space (or distance)

The two points of mechanical theory are obviously connected for the kind of cause which mechanical explanation employs to the exclusion of all others consists in a quantity of motion or of force Just as obviously mechanical explanation dealing only in quantities and in causes which are quantitatively measurable is precisely the type of explanation which would seem to be appropriate if one felt called upon to give an interpretation of the mathematical relationships which the mathematical physicist formulates as laws of nature These mathematical laws are after all statements of the relations among physical quantities which have been subjected to experimental determination or measurement

AS A PHILOSOPHICAL theory the mechanical view of nature antedates modern physical science The atomistic conception of the world which Lucretius expounds contains both of the fundamental points of mechanism—the doctrine of primary and secondary qualities and the doctrine that all effects in nature are produced by efficient moving causes

The controversy over mechanism is also ancient Aristotle denies both points of doctrine in his criticism of the Greek atomists Democritus and Leucippus and in the exposition of his own physical theories he states an opposite view To qualities and qualitative change he assigns physical reality He explains change in terms of four types of causes not one He does not exclude the mechanical type of cause in his explanation of local motion On the contrary with respect to local motion his theory that a body in motion must be directly acted upon by a moving cause throughout the period of its motion seems to be more mechanical than the modern theory that no cause need be assigned for the continuing uniform motion of a body along a straight line but only for a change in its direction or velocity

What is new in modern times is not the philosophical doctrine of mechanism but the introduction of mechanical explanation into experimental and mathematical physics and the controversy about whether it belongs there or can be defended as useful The so called rise and decline of the mechanical view in modern physics is connected with experimental discoveries and mathematical formulations It is not an alternation between success and failure on the level of philosophical argument concerning the ultimate truth of mechanical conceptions. When these conceptions are rejected it is not for the sake of returning to opposite notions in physical theory such as those of Aristotle but rather because as Einstein says science did not succeed in carrying out the mechanical program convincingly and today no physicist believes in the possibility of its fulfillment

There is a touch of prophecy in the conversation Swift imagines taking place between Aristotle and the physicists of the 17th century According to Swift when Aristotle was confronted with Descartes and Gassendi he freely acknowledged his own mistakes in natural philosophy because he proceeded in many things upon conjecture as all men must do and he found that Gassendi who had made the doctrine of Epicurus as palatable as he could and the *vortices* of Descartes were equally exploded He predicted the same fate to *attraction* whereof the present learned are such zealous asserters He said that new systems of nature were but new fashions which would vary in every age and even those who pretend to demonstrate them from mathematical principles, would flourish but a short period of time and be out of vogue when that was determined

BOTH GALILEO and Descartes re-state the philosophical doctrine which first appears in ancient atomism but both re-state it in a way that suggests its utility for an experimental investigation of nature It is significant that Galileo s statement occurs in the context of his concern with the nature and causes of heat He wishes to explain he writes in *Il Saggiatore* why he thinks that motion is the cause of

heat To do this he finds it necessary to question a prevalent notion which is very remote from the truth —the belief that there is a true accident affection or quality really inherent in the substance by which we feel ourselves heated He denies the physical reality of heat as an inherent quality of bodies on the same ground that he denies the physical reality of other qualities I do not believe he declares that there exists anything in external bodies for exciting tastes smells and sounds but size, shape quantity and motion swift or slow and if ears tongues and noses were removed I am of the opinion that shape quantity and motion would remain but there would be an end of smells tastes and sounds which apart from the living creature I regard as mere words

Descartes statement of the doctrine is bolder perhaps in its suggestion of a mechanical program for physical research Colors odors savors and the rest of such things he writes are merely sensations existing in my thought They differ from the real properties of bodies just as much as pain differs from the shape and motion of the instrument which inflicts it The true physical properties such as gravity hardness the power of heating of attracting and purging consist in Descartes opinion solely in motion or its absence and in the configuration and situation of [bodily] parts

As a philosophical doctrine the mechanical view is not necessarily tied to atomism Descartes opposes atomism as plainly as does Aristotle Furthermore Newton who is an atomist disagrees with both Descartes and the Greek atomists on one fundamental point in mechanical theory The ancient atomists make the actual motion of one particle in collision with another the indispensable cause of a change of motion in the latter Descartes likewise requires one motion to be the cause of another and explains gravity in terms of actual bodily motions Newton rejects Descartes mechanical hypothesis of material vortices as the cause of gravitation He seems to have this in mind and to put Descartes in the same class with Aristotle when he says that hypotheses whether metaphysical or physical whether of occult qualities or mechanical have no place in experimental philosophy

The force of gravity according to Newton is a power of attraction which one body exercises on another without the first being in motion or coming into contact with the second Newton acknowledges the problem of action at-a-distance which his theory raises For the most part he lets it stand as a problem which does not affect the mathematical results of his work But in the Queries he attaches to his *Optics* he suggests by way of solution the hypothesis of an ether as the continuous medium through which gravitational force is exerted In the opinion of later physicists Newton s hypothesis is no less mechanical than Descartes Nor does there seem to be any philosophical grounds for preferring one hypothesis to the other

But Newton s quarrel with Descartes is not on a philosophical issue It turns on which mechanical conception if any at all is to be offered fits best with the mathematical laws of terrestrial and celestial motion which Newton had succeeded in formulating as universal laws of nature Those mathematical laws moreover had the merit of fitting the observed phenomena and so of realizing the scientific ideal of accurate description stated in the most generalized form Newton s triumph over Descartes then is a triumph in mathematical and experimental physics not a triumph in philosophy

Pope s couplet

Nature and Nature s Laws lay h d in Night
God said Let Newton be and all was l ght

records that triumph and celebrates the illumination of nature by the mechanical as well as the mathematical principles of Newton s physics Newton s picture of the world dominates the mind of a century and controls its science Locke speaks of the incomparable Mr Newton and of his never enough to be admired book Hume refers to him as the philosopher who from the happiest reasoning determined the laws and forces by which the revolutions of the planets are governed and directed and even Berkeley who challenges his theories of space time and attraction regrets that he must take issue with the authority of so great a man a man whom all the world admires as the author of a treatise on Mechanics demonstrated and applied to nature

NEWTON'S ACHIEVEMENT is to have accomplished an extraordinary synthesis of all that was good in previous scientific work and a sweeping criticism of all that was considered stultifying That so many and such varied phenomena should be organized mathematically by a theory as simple as Newton's is altogether impressive Equally astonishing is the *predictive power of Newton's laws* and the explanatory power of his mechanics not to mention the technological fruits of the latter in mechanical engineering and the invention of machinery of all sorts Whatever difficulties are implicit in the Newtonian mechanics—subsequently to become with new discoveries more and more perplexing—the scope and grandeur of Newton's book gives mechanics a commanding position with respect to the future of science for at least two centuries

In the century between the publication of Newton's *Mathematical Principles* and the publication in 1787 of Lagrange's *Mecanique analytique* the notion of the mechanical explanation of all the processes of nature writes Whitehead finally hardened into a dogma of science In the next century the mechanical dogma spreads from physics and chemistry throughout the whole domain of natural science—into biology and psychology—and even beyond that into economics and sociology Books bear such titles as *The Mechanistic Conception of Life The Mechanism of Human Behavior Social Statics Social Dynamics* At the end of the 19th century James notes the conquests which are being made on all sides by the mechanical idea Once the possibility of *some* kind of mechanical interpretation is established he writes Mechanical Science in her present mood will not hesitate to set her brand of ownership upon the matter

James himself testifies to the persuasiveness and success of the mechanical dogma though not without some resentment The modern mechanico-physical philosophy of which we are so proud he says because it includes the nebular cosmogony the conservation of energy the kinetic theory of heat and gases etc etc. begins by saying that the *only* facts are collocations and motions of primordial solids and the only laws the changes in motion which changes in collocation bring The ideal which this philosophy strives after he continues is a mathematical world formula by which if all the collocations and motions at a given moment were known it would be possible to reckon those of any wished for future moment by simply considering the necessary geometrical arithmetical and logical implications

Laplace had in fact pictured a lightning calculator who *given the total configuration of* the world at one instant would be able to bring the whole future present to his eyes And James quotes Helmholtz to the effect that the whole problem of physical science is to refer natural phenomena back to unchangeable attractive and repulsive forces whose intensity depends wholly upon distance The solubility of this problem is the condition of the complete comprehensibility of nature

In commenting on this James admits that the world grows more orderly and rational *to the mind which passes from one feature of* it to another by deductive necessity as soon as it conceives it as made up of so few and so simple phenomena as bodies with no properties but number and movement to and fro But he also insists that it is a world with a very minimum of rational *stuff* The sentimental facts and relations he complains are butchered at a blow But the rationality yielded is so superbly complete in *form* that to many minds this atones for the loss and reconciles the thinker to the notion of a purposeless universe in which all the things and qualities men *love* are but illusions of our fancy attached to accidental clouds of dust which will be dissipated by the eternal cosmic weather as carelessly as they were formed

WITH THE 20TH CENTURY a change occurs. The dogma of mechanism may continue *to spread* in other sciences and gain even wider acceptance as a popular philosophical creed but within the domain of the physical sciences certain mechanical conceptions become suspect and a wholesale rejection of classical mechanics (which becomes identified with Newtonian physics) is called for

Einstein for example quotes the passage from Helmholtz that James had cited, in which Helmholtz goes on to say that the vocation of physics will be ended as soon as the reduction

of natural phenomena to simple forces is com plete This *mechanical view* most clearly formulated by Helmholtz, Einstein concedes played an important role in its time but he adds it appears dull and naive to a twentieth century physicist

Einstein reviews the assumptions which physicists had to make in order to construct a mechanical theory of light gravitation and electricity The artificial character of all these assumptions he says and the necessity for introducing so many of them all quite independent of each other was enough to shatter the belief in the mechanical point of view In the attempt to understand the phenomena of nature from the mechanical point of view he continues throughout the whole development of science up to the twentieth century it was necessary to introduce artificial sub stances like electric and magnetic fluids light corpuscles or ether According to Einstein attempts to construct an ether in some simple way have been fruitless but what is more important in his opinion such failures indi cate that the fault lies in the fundamental as sumption that it is possible to explain all events in nature from a mechanical point of view

Does this mean that the contemporary physi cist has found another and better way of ex plaining nature? Is there a non mechanical way of explaining the phenomena which fits the mathematical laws of experimental physics or does discarding mechanics mean relinquishing all efforts to explain nature?

Eddington suggests an answer One of the greatest changes in physics between the nine teenth century and the present day he writes has been the change in our ideal of scientific explanation It was the boast of the Victorian scientist that he would not claim to understand a thing until he could make a model of it and by a model he meant something constructed of le ers geared wheels squirts and other appli ances familiar to the engineer Nature in build ing the universe was supposed to be dependent on just the same kind of resources as any human mechanic The man who could make gravi tation out of cogwheels would have been a hero in the Victorian age Today however Ed dington continues we do not encourage the engineer to build the world for us out of his material but we turn to the mathematician to build it out of his material

We may turn to the mathematician s con struction of the world in his terms but in the tradition of western thought mathematically formulated laws of nature are not with the single exception perhaps of the Pythagoreans regarded as explanations of why things behave as they do or how they work The change from the 19th to the 20th century with respect to our ideal of scientific explanation cannot then be the substitution of the mathematical for the mechanical account of why and how The shift from mechanics to mathematics is rather a shift from explanation as the scientific ideal to the statement of laws which while hav ing maximum generality remain purely de scriptive What Eddington means by building the world out of the material of mathematics seems to be the same as what Galileo means four centuries earlier when he says that the book of nature is written in mathematical language The materials are such symbols as triangles circles and other geometrical figures Without the help of these Galileo writes to Kepler nature is impossible to com prehend

But does the mathematical comprehension of nature mean a causal explanation of it? More explicitly than Eddington Galileo insists that explanation—at least in the sense of stating the causes—is not the business of the mathematical physicist In a passage which cannot be read too often or examined too closely he names three opinions which the philosophers have expressed about the cause of the acceleration of natural motion Some he says explain it by attrac tion to the center others to repulsion between the very small parts of the body while still others attribute it to a certain stress in the sur rounding medium which closes in behind the falling body and drives it from one of its posi tions to another Now all of these fantasies he continues and others too ought to be ex amined but it is not really worthwhile

They ought to be examined by philosophers perhaps but debating them is not worthwhile in those sciences where mathematical demon strations are applied to natural phenomena Perfectly defining the program of mathematical physics Galileo sets himself a limited task

carried with it a doctrine of natural motions to different natural places drawn from the observation of fire rising stones dropping air bubbling up through water Such a doctrine would prevent the search for laws of motion applicable to all bodies and the general character of Aristotle s physics treating qualities as well as quantities seems to have discouraged the application of mathematics even to the study of local motions

The mathematical expression of the laws of motion is Galileo s objective His interest in the new astronomy which affirmed the motion of the earth led him he told Hobbes to the careful study of movements on the earth His aim is simply to describe with precision the motions to be found in a child s play—stones dropped and stones thrown the one the natural motion of free fall the other the violent motion of a projectile It is clear to observation that the motion of a freely falling body is accelerated But though as a mathematical physicist Galileo refrains from asking why this is so he is not satisfied to know simply that it is so He wants to know the properties of such acceleration What is the relation of the rate of increase in velocity to the durations and distances of the fall? How much increase in velocity is acquired and how fast? What is the body s velocity at any given point in the fall? Similarly when Galileo turns to projectiles he wants to know not merely that their trajectory is consistently curvilinear but precisely what curve the path of the projectile describes

Galileo succeeds in answering all these questions without being perturbed by any of the philosophical perplexities connected with space and time nor does he allow questions about the forces involved in these motions to distract him from his purpose to demonstrate everything by mathematical methods With mathematical demonstration he combines observation and experiment and uses the latter to determine which mathematical conclusions can be applied to nature—which principles can be empirically verified as well as mathematically deduced

One of Galileo s principles however seems to outrun ordinary experience and to defy experimental verification In the interpretation of his experiments on inclined planes Galileo expresses an insight which Newton later formulates as the first law of motion sometimes called the law of inertia It declares that every body continues in its state of rest or of uniform motion in a right line unless it is compelled to change that state by forces impressed upon it Though Newton describes his method as one of making experiments and observations and in drawing general conclusions from them by induction the law of inertia seems to be an exception for it is difficult to say as Hume does that we find by experience that a body at rest or in motion continues forever in its present state —that is *unless* it is acted on by some new force

The condition introduced by unless raises Poincare s question Have there ever been experiments on bodies acted on by no forces? If not and if they are impossible then James may be right in saying that the elementary laws of mechanics are never matters of experience at all but have to be disengaged from under experience by a process of elimination that is by ignoring conditions which are always present Because the idealized experiment [which it calls for] can never be performed, the law of inertia according to Einstein can be derived only by speculative thinking consistent with observation

In any case the first law of motion initiates a new departure in physics So far as local motion is concerned Aristotle and his followers look for the cause which keeps a moving body in motion or a stationary body at rest According to Galileo and Newton uniform motion continues naturally without cause Only a change in the velocity or direction of that motion requires a cause such as a force impressed upon it

How radical this innovation is may be judged from its consequences in celestial mechanics which in turn lead to a completely unified dynamics for both celestial and terrestrial motions These advances are the work of Newton s mathematical genius but the ground for them had been laid by the investigations of Galileo Galileo had resolved the curvilinear motion of a projectile into the imparted rectilinear motion and the deflecting pull of gravity This composition of forces—sometimes called the parallelogram law —explains why the path of

the projectile is a parabola The path of the planets in their orbits Kepler had previously shown is another conical curve—an ellipse But Kepler lacking the first law of motion could theorize physically about the cause of the planetary orbits only by looking for a force projected outward from the sun which would sweep around to keep the planets moving in their paths On the other hand a follower of Galil o as Whitehead points out would seek for normal forces to deflect the direction of motion along the curved orbit He would look for a force pulling the planet off its own rec tilinear course inward toward the sun

That is precisely what Newton did When the problem which others had been able to formulate was put to Newton he simply went to his study for the solution He had solved that problem some years before He had found the law of the force which attracting the planets to the sun would produce their elliptical paths and the other proportionalities stated in Kep ler s purely descriptive laws

With that single discovery Galileo s terres trial dynamics becomes a celestial one too and the traditional separation of the heavens from the earth is overcome Newton goes even fur ther He guesses and then shows by arithmetic that the force deflecting the planets around the sun and the moon around the earth is the same force which makes apples fall and stones heavy in the hand He generalizes this insight in his famous inverse square law Every particle of matter attracts every other particle of matter with a force proportional to the mass of each and to the inverse square of the distance be tween them

Accordingly the world can be pictured as one in which material particles each have posi tion in absolute space and a determinate veloc ity The velocity of each particle causes the change of its position and changes in velocity are caused by forces the amounts of which are determined by positions From his laws of motion and this simple law of force Newton is able by mathematical deduction to account for the perturbations of the moon the oblate ness of the earth the precession of the equi noxes the solar and lunar tides and the paths of the comets

But is Newton s law of force as simple as it appears to be at first? Its mathematical mean ing is plain enough and its application to measured phenomena reveals its descriptive scope When we ask however about its physi cal significance we raise difficult questions con cerning the nature of this attractive force and how it operates To call it the force of gravity and to point out that this is a familiar force which everyone experiences in his own person hardly answers the question

GALILEO WOULD NOT have tried to answer it In his *Dialogues Concerning the Two Great Sys tems of the World* one of the characters Sim plicio refers to that manifest cause which everyone knows is gravity To this Salviati replies You should say that everyone knows it is *called* gravity I do not question you about the name he continues but about the es sence of the thing and that he concludes is precisely what cannot be defined

A physicist like Huygens who expects the explanation of natural effects to be expressed in the familiar mechanical terms of bodily impact has other objections I am not at all pleased he writes to Leibnitz about Newton with any theories which he builds on his principle of at traction which seems to me absurd What shocks Huygens is a scandal that Newton him self cannot avoid facing It is the scandal of ac tion at a distance—of the force of gravity be ing propagated instantaneously across great dis tances and producing effects at some remote place but no effects along the way Newton rec ognizes the strangeness of such a force In a letter to Bentley he echoes Huygens protest to Leibnitz That gravity should be innate inherent and essential to matter he says so that one body may act on another at a distance through a vacuum without the mediation of anything else by and through which their ac tion and force may be conveyed from one to another is to me so great an absurdity that I believe no man who has in philosophical mat ters a competent faculty of thinking can ever fall into it

The absurd ty of action-at-a distance seems to be recognized by common sense and philoso phy alike 'No action of an agent Aquinas remarks however powerful it may be acts at a d stance except through a medium and

Kant who regards Newtonian physics as the model of a rational science of nature speaks of *a force of attraction without contact* as a chimerical fancy which we have no right to assume How can Newton avoid this absurdity without violating his rule of method in mathematical physics—not to frame hypotheses?

Newton s dilemma can perhaps be stated in the following alternatives *either* the inverse square law of gravitational attraction is to be treated as a purely mathematical and hence a purely descriptive proposition of great simplicity and generality *or* it must be given physical meaning by a causal explanation of how gravitational force operates On the first alternative Newton can avoid framing hypotheses but the physical meaning of the concepts he employs to state the mathematical law is *then left dark On the second alternative he* can solve the mechanical problem created by such words in his law as attracts and force but only by going beyond mathematical physics into the realm of mechanical hypotheses

Newton s ems to take the first alternative in his *Mathematical Principles of Natural Philosophy* and the second in his *Optics* There he proposes the hypothesis of an ethereal medium to explain the attractive force of gravity Is not this medium he asks much rarer within the dense bodies of the sun stars planets and comets than in the empty celestial spaces between them? And in passing from them to great *distances doth it not grow denser and denser* perpetually and thereby cause the gravity of those great bodies towards one another and of their parts towards the bodies every body endeavoring to go from the denser parts of the medium towards the rare? And thou h this increase of density may at great distances be exceeding slow yet if the elastic force of this medium be exceeding great it may suffic to impel bodies from the denser parts of the medium towards the rarer with all that power which we call gravity

The hypoth sis fits the law of gravitation if as Maxwell points out the diminution of pressure [in the ether] is inversely as the distance from the dense body Newton recognized according to Maxwell that it then becomes necessary to account for this inequality of pressure in this medium and as he was not able to do this he left the explanation of the cause of gravity as a problem for succeeding ages The progress made towards the solution of the problem since the time of Newton Maxwell adds has been almost imperceptible

THE PROBLEM OF the mechanical properties of an ethereal medium occurs in another form in the field of optics Here it is complicated by the *rivalry between two theories of light*—Newton s corpuscular theory and Huygens undulatory *or wave theory* Each involves a mechanical hypothesis—one concerning the motion of particles emitted from the light source and one concerning the wave like propagation of the light impulse throu h a medium Both theories involve the motion of particles In their explanation of the oar which appears bent in the water *both appeal to the action of the particles* in the refracting medium on the light corpuscles *or* the light waves

Both theories furthermore are expressed by their authors in a mathematical form which permits the deduction of quantitative facts like the equality of the angles of incidence and of reflexion the bending of the light ray in refraction according to the law of sines and the recently discovered fact of the finite velocity of light Huygens book gives prominence to the explanation of the strange phenomena of double refraction found in a certain kind of crystal brought from Iceland —Iceland spar But *both theories* seem to be equally competent in dealing with the established facts of reflexion and refraction and the new facts about dispersion

For a century at least their rivalry resembles that between the Ptolemaic and Copernican theories at a time when they seemed equally tenable so far as accounting for the phenomena was concerned Later new discoveries *such as* those by Young and Fresnel tend to favor the wave theory of light but the rivalry continues right down to the present day It remains unresolved at least to an extent which prompts Eddington in reviewing contemporary controversy about the nature of light and electricity to suggest the invention of the word wavicle to signify the complementary use of both particles and waves in the modern theory of radiation

Unlike the rivalry between the Ptolemaic and Copernican systems which seemed for a while to be entirely a matter of different mathematical descriptions of the same phenomena the conflict between these two theories of light involves from the very beginning an issue between *diverse mechanical hypotheses to explain* the phenomena That issue is argued not only with respect to the adequacy of either theory to explain such phenomena as the rectilinear propagation of light and its different behavior in different mediums but it is also debated in terms of the underlying mechanical conceptions As gravitational force acting at a distance raises a mechanical problem which Newton s ether is not finally able to solve so Huygens ether as the medium through which light is propagated in waves raises mechanical problems which if insoluble (as they seem to be) contribute even more heavily to the general scientific scandal of mechanics

The two authors take different attitudes toward *hypotheses and mechanical explanation* Huygens as we have seen begins his book with the express intention to investigate the causes and to express them in terms of mechanical motions Newton on the other hand begins his with a reiteration of his disavowal of hypotheses My design in this book he writes is not to explain the properties of light by hypotheses but to propose and prove them by reason and experiments Nevertheless *Newton s explanation* of how the prism produces from white light the band of colors in the spectrum seems to require the assumption of a distinct kind of light corpuscle for each color and in addition the assumption that although all light particles have the same velocity when they travel together making white light separate particles for different colors are differently refrangible that is differently susceptible to the action of the particles in the refracting medium of the glass

Perhaps only in Newton s somewhat artificially restricted sense of the word hypothesis could these assumptions escape that denomination In any case the existence of Huygens rival theory prevented his escaping a controversy about hypotheses In the Queries attached to his *Optics* he engages in that controversy with an acumen which shows another side of his genius

HUYGENS WAVE THEORY requires what any body would have to call an hypothesis and requires it from the very start It is inconceivable he writes *to doubt that light consists* in the motion of some sort of matter He immediately rejects the notion that light rays consist *in the transport of matter coming to us* from the [luminous] object in the way in which a shot or an arrow traverse the air —if for no other reason because the rays traverse one another without hindrance The similarity between the phenomena of light and the phenomena of sound suggests to him the way that light spreads and causes him to extend the mechanics of sound—conceived as a wave motion—to light

We know that by means of air which is an invisible and impalpable body Huygens argues sound spreads around the spot where it has been produced by a movement which is passed on successively from one part of air to another and that the spreading of this movement *taking place equally on all sides ought* to form spherical surfaces ever enlarging and which strike our ears Now there is no doubt at all that light also comes from the luminous body to our eyes by some movement impressed on the matter which is between the two If in addition light takes time for its passage it will follow that this movement impressed on the intervening matter is successive and consequently it spreads as sound does by spherical surfaces and waves for I call them waves from their resemblance to those which are seen to be formed in water when a stone is thrown into it

Huygens is aware however that the analogy between light and sound is far from perfect If one examines he says what this matter may be in which the movement coming from the luminous body is propagated one will see that it is not the same that serves for the propagation of sound This may be proved he goes on by shutting up a sounding body in a glass vessel from which the air is withdrawn *An alarm clock beating its bell in a* jar without air makes no sound but a jar without air is no less transparent than one with air Since when the air is removed from the vessel the light does not cease to traverse it as before and since waves have to be waves of something and light waves cannot be waves of air they

must be waves of a substance says Huygens which I call ethereal matter

This ether a transparent medium permeating the whole universe proves to be what Einstein calls the *enfant terrible* in the family of hypothetical physical substances Postulated by Huygens in order to explain light mechanically it in turn calls for a mechanical account of its own extraordinary properties Huygens does not avoid this new problem but neither does he undertake to solve it completely

Suppose one takes a number of spheres of equal size made of some very hard substance and arranges them in a straight line so that they touch one another Then says Huygens one finds on striking with a similar sphere against the first of these spheres that the motion passes as in an instant to the last of them which separates itself from the row without one s being able to perceive that the others have been stirred This type of motion in the ether would account for the extreme velocity of light and yet this progression of motion is not instantaneous as the motion of light also is not

Now in applying this kind of movement to that which produces light Huygens continues there is nothing to hinder us from estimating the particles of the ether to be of a substance as nearly approaching to perfect hardness and possessing a springiness as prompt as we choose Beyond this Huygens does not go It is not necessary to examine here he says the causes of this hardness or of that springiness Though we shall ignore the true cause of springiness we still see that there are many bodies which possess this property and thus there is nothing strange in supposing that it exists also in little invisible bodies like the particles of the ether

But difficulties which Huygens did not foresee make his ether more than a strange supposition—almost a mechanical impossibility Huygens had thought that light waves are transmitted in the ether in the way that sound waves are in the air that is longitudinally the direction in which the individual particles vibrate being the same as the direction of the wave motion itself But when in the 19th century it was found that the phenomena of the polarization of light could not be explained by the corpuscular theory but only by the wave theory (thus shifting the scales decisively in favor of the latter) it was also found that the wave theory could explain polarization *only* on the assumption that the motion of the ether particles which produce the light waves is not longitudinal but transverse that is in a direction perpendicular to the waves produced by the vibration of the particles

As Fresnel pointed out at the time the supposition that the vibrations were transverse was contrary to the received ideas on the nature of the vibration of elastic fluids They had all involved as in the case of air as the medium for sound a longitudinal transmission The character of the ether is changed by the requirement that its particles vibrate transversely It ceases to be an air like ether and must be imagined as a jelly like ether

The task which Huygens had postponed—that of giving a mechanical explanation of the ether he had posited in order to state the mechanics of light—becomes in consequence far more difficult if not impossible In their efforts to construct the ether as a jelly like mechanical substance physicists according to Einstein had to make so many highly artificial and unnatural assumptions that they finally decided to abandon the whole program of mechanical explanation

OF NEWTON S TWO objections to the wave theory of light the second by itself seems to create an insuperable difficulty for Huygens ether even before the realization that it must be a jelly like medium

Newton s first objection is that any wave theory is inconsistent with the fact of the rectilinear propagation of light If light consisted in pression or motion propagated either in an instant or in time it would bend into the shadow for he points out pression or motion cannot be propagated in a fluid in right lines beyond an obstacle which stops part of the motion but will bend and spread every way into the quiescent medium which lies beyond the obstacle The waves pulses or vibrations of the air wherein sound consists bend manifestly even though not so much as the waves of water

This objection loses its force when in the

19th century light s bending is experimentally discovered But Newton s other objection gains force when two centuries after he made it a jelly lik density is imposed upon the ether by the experimental facts of polarization This *second objection does not point to the inade quacy of the wave theory* with respect to the phenomena which must be described but rath er calls attention to its inconsistency with ce lestial mechanics

Light travels through inter stellar space But so also do the planets Newton s astronomy ac counts for the motion of the planets with great precision *only on the supposition of no resistance from a medium* To make way for the regular and lasting motions of the planets and comets, he writes, it is necessary to empty the heavens of all matter except perhaps such an ex ceedingly rare ethereal medium as we de scribed above Here he refers to the ether he himself had posited as a possible cause of gravi tational attraction Its resistance he thinks, is *so small as to be inconsiderable* The planets and comets and all gross bodies [can] perform their motions more freely in this ethereal medium than in any fluid which fills all space adequately without leaving any pores Such a dense fluid serves only to disturb and retard the motions of those great bodies and make the frame of nature languish Since it hinders the operations of nature and since there is no evidence for its existence Newton concludes that it ought to be rejected

The next conclusion follows immediately If it be rejected the hypotheses that light consists in pression or motion propagated through such a medium are rejected with it Newton would seem entitled to draw these con clusions because *no matter how slight the den sity of ethereal matter the use of the ether in* the wave theory of light involves some interac tion between the particles of ether and the par ticles of matter Unless such interaction takes place no explanation can be given of the change in the velocity of light when it enters a *medium* like glass or water Since in Newton s universe there is no difference between terres trial and celestial matter Newton cannot ac cept an ether which interacts with the matter of glass or water but does not interact with the matter of the planets

This objection of Newton s pointing to an inconsistency between the kind of ether re quired by the wave theory of light and the un retarded motion of the heavenly bodies ap pears not to have been answered but only waived at the time of the wave theory s as cendancy The famous Michelson Morley ex periment on ether drift later re-opens Newton s penetrating query about the ether But this occurs at a time when physicists are prepared to give up not only the ether but also with it the mechanical explanations of gravity and light which it had brought into conflict with one another

BEFORE THE MECHANICAL dogma runs its course it has a career in other fields of physical inquiry The phenomena of heat magnetism and electricity are explored and explained un der its inspiration The history of these sub jects is marked by a very rash of hypotheses. Each time mechanical explanation is attempted for a new domain of phenomena new sub stances are added

The postulated entities—calorific magneti cal and electric fluids—are unobservable and without weight In Newton s terms they are occult though it must be added they are no more occult than the ether Newton himself postulated to explain gravity or the ether Huy gens postulated to explain light In fact each of these new substances seems to resemble the aeriform or fluid ether just as each is con ceived as the gravitational or optical ether was earlier conceived in the context of the issue of action-at-a-distance as opposed to action by contact They would seem to be unavoidable in a mechanical account of the radiations of heat magnetism and electricity

The phenomena of heat Lavoisier writes are difficult to comprehend without admit ting them as the effects of a real and material substance or very subtle fluid Where fore he continues we have distinguished the cause of heat or that exquisitely elastic fluid which produces it by the term of caloric Lavoisier declares himself unable to determine whether light be a modification of caloric or if caloric be on the contrary a modification of light But in terms of observed effects he does attribute ether like properties to caloric This

subtle matter he says penetrates through the pores of all known substances for there are no vessels through which it cannot escape

The theory of caloric serves its purpose before it gives way to the theory of heat as molecular *motion* a conception which can be integrated with the molecular or kinetic theory of gases The development of the kinetic theory of matter writes Einstein is one of the greatest achievements directly influenced by the mechanical view It is all the more striking therefore that in the opening pages of Fourier s *Analytical Theory of Heat*—wherein he reviews the triumphs of explanation achieved by Newton and his successors—Fourier should so flatly assert But whatever may be the range of mechanical theories they do not apply to the effects of heat These make up a special order of phenomena which cannot be explained by the principles of motion and equilibrium

It is equally striking that Lavoisier seems to have anticipated not only the mechanical theory of heat but the possibility of a purely mathematical treatment of the phenomena We are not obliged to suppose [caloric] to be a real substance he writes it is sufficient that it be considered as the repulsive cause whatever that may be which separates the particles of matter from each other so that we are still at liberty to investigate its effects in an abstract and mathematical manner

The second of these two things is precisely what Fourier proposes to undertake but he disavows any interest in the first namely the explanation of heat in terms of the mechanical separation of particles by repulsion In language which resembles Newton s disavowal of concern with the cause of attraction Fourier declares that primary causes are unknown to us but are subject to simple and constant laws which may be discovered by observation

In another place he writes Of the nature of heat only uncertain hypotheses could be formed but the knowledge of the mathematical laws to which its effects are subject is independent of all hypothesis Fourier s aim therefore with respect to the very extensive class of phenomena not produced by mechanical forces but resulting simply from the presence and accumulation of heat is to reduce the physical questions to problems of pure analysis and to express the most general conditions of the propagation of heat in differential equations He expresses his indebtedness to Descartes for the analytical equations which that mathematician was the first to introduce into the study of curves and surfaces but which are not restricted to the properties of figures and those properties which are the object of rational mechanics These equations he insists extend to all general phenomena and from this point of view mathematical analysis is as extensive as nature itself

This strongly worded statement affirms the mathematical character of nature as the support and justification for a purely mathematical physics If Fourier s remarks about causes and hypotheses are reminiscent of Newton in his mathematical mood how much more is Fourier s faith in pure mathematical analysis reminiscent of Galileo Like Galileo and unlike Newton Fourier never deviates from his indifference to causes and never softens his judgment of the incompetence and irrelevance of mechanics to the subject he is investigating His trust in mathematical analysis which is able by itself to yield and organize physical discoveries not only revives the spirit of Galileo but also seems to have inspired Clerk Maxwell to turn from a mechanical to a mathematical theory of electricity

Certain of Fourier s mathematical achievements such as his theory of dimensions prove useful to Maxwell More important perhaps is the fact that Maxwell s predictions about the propagation of electro magnetic waves, later experimentally verified by Hertz are the result of mathematical analysis With such a demonstration of the power of mathematics to work fruitfully with experiment and *without any aid from mechanical hypotheses* Maxwell gives up the attempt to formulate a mechanics for his equations describing the electro magnetic field He is quite content to let his field theory state the mathematical structure of the phenomena

Between Fourier and Maxwell comes Faraday One of the greatest experimenters in the whole tradition of science Faraday discovers the phenomena whose mathematical structure Maxwell later develops He prepares the way

for Maxwell s application to electricity and magnetism of the method Fourier had prac ticed His speculations concerning the relation of electrical and gravitational force point ahead beyond Maxwell to the possibility of a field theory which might unify all physical phenom ena under a single set of mathematical laws

Faraday sees no incompatibility between ex perimentation and speculation On the con trary he says that as an experimentalist I feel bound to let experiment guide me into any train of thought which it may justify being satisfied that experiment like analysis must lead to strict truth if rightly interpreted and believing also that it is in its nature far more suggestive of new trains of thought and new conditions of natural power Faraday s faith seems to have been amply justified His experi ments not only discovered a stunning number of new facts but the speculations to which they led transformed the whole mode of thinking about electricity and magnetism and to some extent the whole of physics

The Elizabethan Gilbert with his bold and brilliantly handled thesis that the earth is a magnet had made magnetism appear some thing more than a random phenomenon occa sionally met with in nature But not until Faraday s discovery of d amagnetism an nounced in a memoir *On the Magnet c Cond t on of All Matter* would anyone have dared to say that all matter appears to be subject to the magnetic force as universally as it is to the gravitating the electric and the chemical or cohesive forces Of electricity he can only pred ct as the result of his protracted experi mental investigations that it is probable that every effect depending upon the powers of in organic matter will ultimately be found subordinate to it

These remarks indicate the controlling theme of Faraday s researches namely the convertibility and unity of natural forces It seems to have been suggested to him by the discovery that both electrical and magnetic forces obey the same simple inverse square law as the force of gravitational attraction The fact that certain forces obey the same law or that their action can be described by the same equations, would not of itself reveal whether one of these forces is primary or all are de rivative from some other primary force But it would suggest questions to be asked by experi ment

Gilbert compares magnetism and electricity but he is not able to convert one into the other Oersted before Faraday is the first to establish one aspect of their convertibility He shows that an electric current has a magnetic effect Faraday succeeds in showing the reverse—that a magnetic current has electrical power He expresses his fascination with such reversibili ties in his remarks on the electrical torpedo fish Seebeck he writes taught us how to commute heat into electricity and Peltier has more lately given us the strict converse of this and shown us how to convert electricity into heat Oersted showed how we were to con vert electric into magnetic forces and I had the delight of adding the other member of the full relation by reacting back again and con verting magnetic into electric forces So per haps in these organs where nature has pro vided the apparatus by means of which the fish can exert and convert nervous into electric force we may be able possessing in that point of view a power far beyond that of the fish itself to reconvert the electric into the nervous force

Faraday demonstrates still another such re versibility in nature The nature of his discov ery is indicated by the titles of the papers in which he announces it *On the Magnetiz at on of Light and the Illuminat on of Magnet c Lines of Fo ce* and *The Act on of Electric Currents on Light* These papers in his opinion establ shed for the first time a true direct relation and dependence between light and the magnetic and electric forces and he concludes them with an explicit statement of the central theme of all his researches and speculations

Thus a great addition is made he writes to the facts and considerations which tend to prove that all natural forces are tied together and have one common origin It is no doubt difficult in the present state of our knowledge to express our expectation in exact terms and though I have said that another of the powers of nature is in these exper ments directly related to the rest I ought perhaps rather to say that another form of the great power is distinctly and directly related to the other forms

ONE FORM OF the great power remained to be connected with such other forms as those of light heat electricity and magnetism That was the power of gravitational force Faraday comes to this last stage of his speculations concerning the unity of nature s powers in terms of his conception of lines of force and of what later came to be called the field of force

The earliest theories of electricity and magnetism in an orthodox atomistic vein had conceived them as exerting an influence by means of the effluvia which they emitted Newton for example speculates on how the effluvia of a magnet can be so rare and subtle as to pass through a plate of glass without any resistance or diminution of their force and yet so potent as to turn a magnetic needle beyond the glass When electrical conduction is later discovered effluvia are replaced by fluids on the analogy of caloric as the fluid conductor of heat But when Faraday finds that he can induce from on current to another he becomes interested in the dielectric non conducting medium around the circuits He is strongly averse to any theory which involves action at a-distance and so he argues that induction takes place by the action of contiguous particles To support that argument he shows experimentally that electrical induction can turn a corner

From his study of all the phenomena of magnetism Faraday forms the conception of lines of force and concludes that there is a center of power surrounded by lines of force which are physical lines essential both to the existence of force within the magnet and to its conveyance to and exertion upon magnetic bodies at a distance He says of this idea of lines of force that all the points which are experimentally established with regard to [magnetic] action *i e* all that is not hypothetical appear to be well and truly represented by it and he adds Whatever idea we employ to represent the power ought ultimately to include electric forces for the two are so related that one expression ought to serve for both

Subsequently Faraday satisfies himself as to the physical reality of electrical lines of force in addition to the magnetic lines The compulsion of his interest in the unity of nature then drives him to speculate about gravitational force He begins by admitting that in the case of gravitation no effect sustaining the idea of an independent or physical line of force is presented to us as far as we at present know the line of gravitation is merely an ideal line representing the direction in which the power is exerted But encouraged perhaps by Newton s repeated references to the attractions of gravity magnetism and electricity and by Newton s letter to Bentley which he interprets as showing Newton to be an unhesitating believer in physical lines of gravitating force Faraday goes to work experimentally

The report of these researches *On the Possible Relation of Gravity to Electricity* opens with the re statement of Faraday s central theme The long and constant persuasion that all the forces of nature are mutually dependent having one origin or rather being different manifestations of one fundamental power has made me often think of establishing by experiment a connexion between gravity and electricity and so introducing the former into the group the chain of which including also magnetism chemical force and heat binds so many and such varied exhibitions of force together by common relations His experiments he tells us unfortunately produced only negative results but that does not shake his strong feeling of the existence of a relation between gravity and electricity

THOUGH FARADAY FAILS to prove that such a relation exists he does bequeath as a legacy to 20th century physics the problem of a field theory which would embrace both gravitational and electrical force But whereas Faraday conceives the problem mechanically in terms of the physical reality as well as unity of all lines of force in which contiguous particles act on one another those who inherit the problem from him cease to concern themselves with the physical existence of lines of force and their mechanical basis in the action and reaction of bodies Influenced by the amazing generality implicit in Maxwell s field equations they proceed to search for a purely mathematical statement of nature s structure

In the judgment of the 20th century physicist mathematics may at last succeed in doing precisely what mechanics from Newton to Faraday kept promising but forever failing to

do If the unity of nature can be expressed in a single set of laws they will be according to Einstein laws of a type radically different from the laws of mechanics Taking the form of Maxwell s equations a form which appears in all other equations of modern physics they will be he writes laws representing the *structure* of the field

In saying that Maxwell s equations are structure laws and that they provide a new pattern for the laws of nature Einstein means to emphasize their non mechanical character In Maxwell s theory he writes there are no material actors Whereas Newton s gravitational laws connect the motion of a body here and now with the action of a body at the same time in the far distance Maxwell s equations connect events which happen now and here with events which will happen a little later in the immediate vicinity Like the equations which describe the changes of the electromagnetic field our new gravitational laws are according to Einstein also structure laws describing the changes of the gravitational field

The heart of the difference between a structure law and a mechanical law seems to be contained in Einstein s statement that all space is the scene of these laws and not as for mechanical laws only points in which matter or changes are present This contrast between matter and space brings to mind the difference between physics and geometry Yet Einstein s repeated reference to changes in these space structures also reminds us that the electrical and gravitational fields are not purely geometrical but physical as well

The structure laws of the new physics may be geometrical in form, but if they are to have any physical meaning can they entirely avoid some coloring *by the mechanical conceptions* which have been traditionally associated with the consideration of matter and motion? At least one contemporary physicist appears to think that mechanics survives to bury its undertakers After describing the development in which geometry progressively swallowed up the whole of mechanics Eddington observes that mechanics in becoming geometry remains none the less mechanics The partition between mechanics and geometry he continues has broken down and the nature of each of them has diffused through the whole so that besides the geometrisation of mechanics there has been a mechanisation of geometry

According to this view it is not mechanics but *classical* mechanics which the new physics has abandoned The character of the mechanics seems to have altered with the character of the mathematical formulations Field theory dealing with contiguous areas and successive events avoids the problem of action at a distance and also apparently that problem s classical solution in terms of the action of contiguous particles But another sort of mechanics may be implicit in the field equations which connect events in one area with events in the immediate vicinity If those equations had been available to him Newton might have expressed his theory of a variably dense ether—analogous to the modern conception of a variably filled or variably curved space—in terms of structure laws describing the gravitational field

We are left with a number of questions Is the story of mechanics the story of its rise and decline or the story of its changing role—now dominant now subordinate now more manifest now more concealed—at all stages in the development of a physics which is committed to being both mathematical and experimental? Do the status and character of mechanical conceptions change with changes in the form of the mathematical laws which describe the phenomena? Can physics be totally devoid of mechanical insight and yet perform experiments which somehow require the scientist to act on bodies and to make them act on one another? Could a pure mathematical physics have yielded productive applications in mechanical engineering *without the intermediation of mechanical notions of cause and effect?*

Whichever way these questions are answered we face alternatives that seem to be equally unsatisfactory *Either* experimental physics is purely mathematical and proclaims its disinterest in as well as its ignorance of causes *or* physics cannot be experimental and mathematical without also being mechanical and without being involved in a search for causes which are never found

To the layman there is something mysterious

about all this He stands in awe of the physicist s practical mastery of matter and its motions which he naively supposes to depend upon a scientific knowledge of the causes while all the time the scientists protest that the causes remain unknown to an experimental and mathematical physics Mechanical explanations may be offered from time to time but the various forces they appeal to can be understood only from their effects and are nothing more than verbal shorthand for the formulae or equations which express the mathematical laws Yet they remain cause names and seem to stimulate advances in science—both experimental and mathematical—almost as a consequence of the exasperating elusiveness of these hidden causes

Certain philosophers hold a view which suggests that the clue to the mystery may lie in the word hidden Causes exist and we can control them to build machines and explode bombs *but we cannot with our senses catch* them in the very act of causing or perceive the inwardness of their operation If the fact that they are thus unobservable means that they are occult then all causes are occult—not least of all the mechanical type of cause which consists in the impact of one body upon another In the century in which physicists tried to avoid the scandal of forces acting at a distance by postulating mechanical mediums through which one body acted directly on another philosophers like Locke and Hume express their doubts that such causal action is any less occult than Newton had said Aristotle s causes were

The passing of motion out of one body into another Locke thinks is as obscure and unconceivable as how our minds move or stop our bodies by thought The increase of motion by impulse which is observed or believed sometimes to happen is yet harder to understand *We have by daily experience* clear evidence of motion produced both by impulse and by thought but the manner how hardly comes within our comprehension we are equally at a loss in both In Locke s judgment we will always remain ignorant of the several powers efficacies and ways of operation whereby the effects which we *daily see are produced* If scientific knowledge is knowledge of causes then how far soever human industry may advance useful and experimental philosophy in physical things scientifical will still be out of our reach

When we try to observe efficient causes at work what do we see? Hume answers that we only see one thing happening after another The impulse of one billiard ball is attended with motion in the second This is the whole that appears to the *outward* senses Nor can we form any *inward* impression of what takes place at the moment of impact We are ignorant he writes of the manner in which bodies operate on each other and we shall always remain so for their force or energy is entirely incomprehensible

As the chapter on CAUSE indicates Aristotle holds an opposite view of the matter What takes place in efficient causation may be imperceptible but it is not incomprehensible All causes may be occult so far as the senses are concerned but they are not obscure to the intellect But Aristotle would also insist that the action of efficient causes cannot be understood if they are totally isolated from other causes—material formal final A purely mechanical physics in his opinion defeats itself by its basic philosophical tenets which exclude all properties that are not quantitative and all causes except the efficient Only a different metaphysics—one which conceives physical substances in terms of matter and form or potentiality and actuality—can yield a physics which is able to deal with causes and explain the phenomena but such an Aristotelian physics from the modern point of view stands condemned on other grounds It is not experimental It is not productive of useful applications *It is not mathematical* nor is it capable of comprehending all the phenomena of nature under a few simple universal laws

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and pa e numbers of the passages referred to For example in 4 HOMER *Il ad* BK II [265–283] 12d the number 4 is the number of the volume in the set the number 12d ind cates that the pas sage is in section d of page 1

PAGE SECTIONS When the text is printed in one column the letters a and b refer to the upper and lower halves of the pa For example in 53 J ES *Psychology* 116a 119b the passa e begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b efer to the upper and lower halves of the left ha d side of the page the letters c and d to the upper and lower halves of the right hand s de of the p ge For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the ri ht hand side of p ge 164

Chapter 55 MEDICINE

INTRODUCTION

MEDICINE is the name of an art of a science or group of sciences and of a learned profession whose members are profi cient in these sciences and experienced in the practice of the art By derivation it is also the name for curative drugs physics or other rem edies prescribed by the physician The archaic usage of the English word physic as the name for the art practice and profession of what is now generally called medicine suggests what the word s Greek root signifies namely that the physician no less than the physicist is a student of nature

There is one other historic use of medicine which indicates its scope and connections in the western tradition When mediaeval institutions first shaped the university the basic divisions of learning then embodied in its structure re flected *different uses of learning as well as dif* ferences in subject matter The three faculties of medicine law and theology not only disci plined their students in different branches of knowledge but also trained them for distinct applications of knowledge to practice

The faculty of m d cine represented all the natural sciences especially those which have come to be called *biological sciences* just as the faculty of law or jurisprud nce represented all the moral sciences and their later offshoots now called social sciences The doctor of medicine was concerned with knowl dge bear ing on the relation of man to nature as the doctor of laws was concerned with knowledge bearing on the relation of man to man and the doctor of theology with knowledge bearing on the relation of man to God

It is a curious accident that the word doc tor which in origin signified the competence to teach others who might practice in each of these great fields of learning has come in popu lar usage to designate not the teacher but the practitioner and chiefly the practitioner in only one of the learned professions Medicine may not deserve the implied emphasis upon the learning of its practitioners but there would be some truth in granting it the distinction of being the oldest of the profes ions in the sense that it comprises a group of men who not only share a common training in the relevant sciences and arts but who also have adopted a code of practice and obligated themselves to perform a service to their fellow men

The Hippocratic Oath sworn to in the name of Apollo the physician and Aesculapius and Health and all the gods and goddesses is the first explicit formulation of a professional ideal In the collection of writings attributed to Hippocrates *The Law* explicitly indicates as *The Oath* implies that there are intellectual as *well as moral conditions to be fulfilled by those* who would dedicate themselves to the service of health Only those who have satisfied all req uisites for the study of med cine and by dil gent application have acquired a true knowl edge of it shall be esteemed physicians not only in name but in reality

The same high conception of medicine ap*pears in the Bible* We read *in Ecclesiasticus* Honor the physician for the need thou hast of him for the most High hath created him For all heal ng is from God and he shall receive gifts of the king The skill of the physician shall lift up his head and in the sight of great men he shall be praised The most High hath created medicines out of the earth and a wise man will not abhor them The *virtue of these things* is come to the knowledge of men and the most High hath given knowledge to men that he may be honored in his wonders By these he shall cure and shall allay their pains and of these the apothecary shall make sweet confec-tions and shall make up ointments of health

and of his works there shall be no end For the peace of God is over all the face of the earth

FIVE OF THE authors of the great books—Hippocrates Galen Gilbert Harvey and Freud—belonged to the profession of medicine They were major figures in its history Practitioners of its arts they were also contributors to the sciences concerned with health and disease Three others combined medicine with other pursuits Copernicus studied medicine at Padua and devoted considerable time to its practice Locke was Lord Shaftesbury s personal physician James took a medical degree at Harvard after years spent in the biological sciences Still another Rabelais not only studied and practiced medicine but also edited the *Aphorisms of Hippocrates and Galen s little treatise on the medical art* His knowledge of medicine and his observation of its contemporary practices can be readily discerned in his comic exaggerations of anatomical and physiological detail and of regimens of diet or exercise

The discussion of medicine in the great books is not limited to its professors or practitioners Montaigne has many doubts about medical diagnosis and the possibility of charting the causes of disease or the remedies which cure The patient s ignorance permits the physician to claim credit for his successes and to blame fortune for his failures

Montaigne characteristically delights in observing that the doctors disagree He offers as one example of the ancient controversy in physics the following Herophilus lodges the original cause of all disease in the humours Erasistratus in the blood of the arteries Asclepiades in the invisible atoms of the pores Alcmaeon in the exuberance or defect of our bodily strength Diocles in the inequality of the elements of which the body is composed and in the quality of the air we breathe Strato in the abundance crudity and corruption of the nourishment we take and Hippocrates lodges *it in* the spirits There is no great danger he adds, in our mistaking the height of the sun or the fraction of some astronomical *computation* but here where our whole being is concerned tis not wisdom to abandon ourselves to the mercy of the agitation of so many *contrary* winds

Such commentary as this bears more on the history of medicine than on the abiding problems of its science or art which from Hippocrates to Freud have been more generally agreed upon than the theories propo ed for their solution Of similar historical significance are the passages in the great works of history which describe the phenomena of disease as they appeared to contemporary observers the plagues which ravaged Ath ns Rome and London or the maladies which afflicted eminent individuals Poetry as well as history and biography contributes to this record The novels of Tolstoy and Fielding the plays of Shakespeare the tales of Cervantes and Chaucer the Greek tragedies and the Homeric epics furnish evidence of both the constant and the *changing elements in the conception of disease* the vocation of medicine and the social acceptance of the physician

The history of medicine is an *epitome of the* history of the natural sciences The researches of the Hippocratic school initiate specific methods of empirical investigation such as the systematic collection and comparison of observations and the painstaking record of individual ca e histories The fundamental con epts of medical theory reflect the philosophy of nature and of man Conflicting notions of the causes of disease focus major issues in biology such as the controversy in which Galen engages with Asclepiades and Erasistratus in the defense of what he supposes to be Hippocrates and Aristotle s organic view of nature against mech anism and atomism

Medicine moreover provides some of the clearest examples of the interdependence of theory and practice for the rules of the healin art put theories to work and to the test and as the rules are refined or altered by the accumulated experience of particular cases inductive insight lea ds to ne v theoretical generalizations As the work of Dr Harvey illustrates biological science is both the source and the reflection of medical knowledge Medicine also affords Bacon and Descartes the *prime* example of a useful application of the knowledge gained by the new methods they propose

More than engineering or the invention of mechanical utilities medicine represents for them knowledge in the service of mankind

That science shall bear fruit in technolo_gy is not merely to be desired writes Descartes with a view to the invention of an infinity of arts and crafts but principally because it brings about the preservation of health which is without doubt the chief blessing and the foundation of all other blessings in this life It is true that the medicine which is now in vogue contains little of which the utility is re markable but without any intention of de crying it I am sure that there is no one even among those who make its study a profession who does not confess that all that men know is almost nothing in comparison with what re mains to be known

The subsequent history of medicine some of the great documents of which are cited in the list of *Additional Readings* under the names of Jenner Bichat Virchow Claude Bernard and Koch seems to substantiate Descartes proph ecy But it also seems to be true that the major problems of med cal practice are not greatly altered or diminished by the tremen dous increase in our knowledge of the causes of specific diseases and our vast store of well tested remedies

What sort of art medicine is to what extent the physician should let nature run its course with what restraint or prudence the physician should apply general rules to particular cases whether health is better served by the general practitioner treating the whole man or by a specialist treating a special organ how the re lation of the physician to his patient i itself a therapeutic factor and underlies the effective ne s of his skill in all other respects to what extent mind and body interact both in the ori gin and in the cure of disease—these are the problems of medicine concerning which Hip pocrates and Galen can converse with Osler and Freud almost as contemporaries

THE DISTINCTION made in the chapter on ART between the simply productive and the coop erative arts associates med cine with agriculture and teaching and separates these arts which merely help a natural result to come about from the arts which produce an effect that would never occur w thout the work of the artist Plants grow and reproduce without the he p of farmers The mind can discover some truth without the aid of teachers Animals and men can preserve and regain their health with out the care of physicians But without shoe makers or house builders shoes and houses would not be produced

The art of medicine does not produce health in the sense in which the shoemaker produces a shoe or the sculptor a statue These other arts imitate nature by embodying natural forms or functions in materials wherein they do not nat urally arise An art like medicine seems to imi tate nature by cooperating with natural pro cesses It follows the course of nature itself and by working with it enables the natural result to eventuate more surely than it might if art made no attempt to overcome the factors of chance

Socrates expresses this understanding of the physician s art when he uses the metaphor of midwifery to characterize his own method of teaching As it is the mother who labors and gives birth so it is the student who is primarily active in the process of learning The teacher like the midwife merely assists in a natural process which mi_ght be more painful and might po sibly fail without such help The teacher writes Aquinas only brings exterior help as does the physician who heals just as the interior nature is the principal cause of the healing so the interior light of the intellect is the principal cause of knowledge

Health he continues is caused in a sick man sometimes by an exterior principle name ly by the medical art sometimes by an interior principle as when a man is healed by the force of nature Just as nature heals a man by al teration digestion rejection of the matter that caused the sickness so does art The exte rior principle art acts not as a primary agent but as helping the primary a_gent which is the interior principle and by furnishing it with in struments and assistance of which the interior principle makes use in producing the effect Thus the phys cian strengthens nature and em ploys food and med cine of which nature makes use for the intended end

The subord nation of the medical art to na ture seems to be the keystone of the whole structure of Hippocratic medic n It is im plied in the emphasis which Hippocrates places on the control of the patient s regimen espe

cially the elements of his diet the exercise of his body and the general circumstances of his life Even in the treatment of acute diseases Hippocrates looks to the regimen first prescribing changes or special articles of diet

Medicines or drugs perform an auxiliary function Surgery is always a last resort to be used primarily in the treatment of injuries and not to be employed in diseases which will yield to a course of regimen and medication There is an element of violence in surgery which puts it last among the means of an art which should work by cooperating with nature rather than by operating on it And among medicines those are preferable which like ptisan a special preparation of barley water derive their efficacy from properties similar to those of normal nutriment

According to Hippocrates the control of regimen is not only the primary factor in therapy but also the original principle of medicine In the treatise *On Ancient Medicine* he points out that the art of medicine would not have been invented at first nor would it have been made the subject of investigation (for there would have been no need for it) if when men are indisposed the same food and other articles of regimen which they eat and drink when in good health were proper for them and if no other were preferable to these The diet and food which people in health now use would not have been discovered provided it suited man to eat and drink in like manner as the ox the horse and all other animals What other object then has he in view who is called a physician and is admitted to be a practitioner of the art who found out the regimen and diet befitting the sick than he who originally found out and prepared for all mankind that kind of food which we all now use in place of the former savage and brutish mode of living?

The same conception of medicine s relation to nature seems to be fundamental in Galen s thought He attributes to Hippocrates his own reformulation of the insight that the art of healing consists in imitating the health giving and healing powers of nature itself The medical doctrines which he criticizes were based on the atomism of Epicurus They regarded the body as a complex piece of machinery When it gets out of order it needs a mechanic and mechanical remedies to fix it On the contrary it seems to him the living body is an organic unity not an aggregation of atoms or a system of interlocking parts

Nature is not posterior to the corpuscles but a long way prior to them Galen writes Therefore it is nature which put together the bodies both of plants and animals and this she does by virtue of certain faculties which she possesses—these being on the one hand attractive and assimilative of what is appropriate and on the other expulsive of what is foreign Further she skillfully moulds everything during the stage of genesis and she also provides for the creatures after birth employing here other faculties again

Nature according to Galen works not by the external impact of part upon part but by its faculties or powers for the performance of natural functions and the production of natural effects Galen s polemic against the mechanists thus leads him to reverse the usual statement Where Hippocrates looks upon nature as the model for art to follow Galen calls Nature the artist in order to set his view in sharp contrast to all mechanical conceptions Instead of admiring Nature s artistic skill he declares they even go so far as to scoff and maintain that things have been made by Nature for no purpose! Nature Galen holds produces effects according to its powers and in conformity to its needs It seems to work with intelligence and for an end not blindly and by chance The true art of medicine therefore borrows its method from Nature s art

The conception of nature as an artist may be taken metaphorically or literally but the insight controlling the practice of medicine remains the same The physician is a servant not a master of nature Aristotle s doctrine of final causes summarized in the maxim Galen so often repeats—that nothing is done by Nature in vain —furnishes a principle for physiological research as well as the rules of medical art Whether because of faulty observation on his part or because of a failure to apply his own principle Galen leaves to Harvey one of the great discoveries which can be credited to close attention to final causes Always observant of the relation between structure and function,

lways questioning the purpose which bodily rgans serve Harvey establishes the fact that he blood circulates and finds therein the reason or the structure of the heart its motions and ts relation to the lungs

It may also be possible for a principle to be carried to excess Montaigne for example expresses his distrust of medical theory and the physician s remedies by an unqualified trust in nature s own resourcefulness Drugs especially purgatives, do violence to nature Men disturb and irritate the disease by contrary oppositions it must be the way of living that must gently dissolve and bring it to an end The violent gripings and contest betwixt the drug and the disease are ever to our loss since the combat is fought within ourselves and that the drug is an assistant not to be trusted being in its own nature an enemy to our health and by trouble having only access into our condition Let it alone a little the general order of things that takes care of fleas and moles also takes care of men if they will have the same patience that fleas and moles have to leave it to itself

Nor is there any need for an art of medicine when nature can do better by herself We ought to grant free passage to diseases I find they stay less with me who let them alone and I have lost some reputed the most tenacious and obstinate by their own decay without help and without art and contrary to its rules Let us a little permit Nature to take her own way she better understands her own affairs than we The Hippocratic doctrine seems to occupy a middle ground between this view of nature as an unerring artist and the opposite extreme which permits all sorts of tampering and tinkering with the machinery of the body

THE ART OF MEDICINE consists in three things writes Hippocrates the disease the patient, and the physician The physician is the servant of the art and the patient must combat the disease along with the physician With regard to diseases the physician must have two special objects in view to do good and to do no harm

This celebrated summary indicates the two kinds of knowledge which the physician should possess He should know about disease in general so that he can classify diseases according to their special causes their symptoms, and the typical course each seems to take Such knowledge underlies the doctor s diagnosis of the patient s malady That in turn determines his prognosis of the stages through which the illness will run from its onset through various crises or turning points to its *sequelae* or consequences Upon the accuracy of his diagnosis and the certainty of his prognosis may depend the effectiveness of any remedy the physician prescribes in the individual case

But individual cases are seldom completely alike The physician must therefore know the patient as an individual and all the relevant circumstances of his life as well as the particular characteristics of this instance of the disease even though its general characteristics are familiar to him from much experience in the treatment of similar cases The *Book of Prognostics* and the treatise *Of the Epidemics* in the Hippocratic collection seem to combine both these kinds of knowledge They enumerate the symptoms by which diseases can be recognized and their future foretold They also set forth individual case histories from which such generalizations can be drawn

The practice of medicine thus appears to require more than scientific knowledge of health and disease in general and more than general rules of art It requires the sort of experience which can be gained only from actual practice Without prudence born of experience general rules can be misapplied for no general rule in medicine as in law fits all cases alike The most famous of Hippocratic aphorisms conveys a sense of the hazards of medical practice Life is short and Art long the crisis fleeting experiment perilous and decision difficult The physician must not only be prepared to do what is right himself but also to make the patient the attendants and the externals cooperate

To persuade the patient to cooperate is the first maxim governing the physician s relation to his patient Plato contrasts the right and wrong relation between doctor and patient by comparing the practice of the physicians who treated slaves and those who treated free men The slave doctor he says prescribes what mere experience suggests as if he had exact knowledge and when he has given his orders like a tyrant he rushes off with equal assurance

to some other servant who is ill But the other doctor who is a freeman attends and practices upon freemen and he carries his enquiries far back and goes into the nature of the disorder he enters into discourse with the patient and with his friends and is at once getting information from the sick man and also instructing him as far as he is able and he will not prescribe for him until he has first convinced him at last when he has brought the patient more and more under his persuasive influences and set him on the road to health he attempts to effect a cure

In the treatment of mental diseases as Freud points out the proper development and management of the relationship between patient and physician is itself a major factor in psychotherapy It presupposes a profound interest for psychological incidents as well as a personal sympathy for the patient he writes It requires the full consent and the attention of the patients but above all their confidence for the analysis regularly leads to the inmost and most secretly guarded psychic processes Since fears anxieties or other temperamental dispositions on the part of the patient may affect the course of an organic ailment the patient s confidence in the physician and even more generally his emotional response to the physician s character play an important role in the successful treatment of bodily ills as well as of mental or functional disorders

Hippocrates recommends that the physician cultivate prognosis not only for the guidance of his own actions but also for the sake of the patient By foreseeing and foretelling in the presence of the sick the present the past and the future and explaining the omis ions which patients have been guilty of he will be the more readily believed to be acquainted with the circumstances of the sick so that men will have confidence to entrust themselves to such a physician

THE RELATION OF physician and patient raises a question about the organization of the practice of medicine to which opposite answers have been given in both ancient and modern times Herodotus reports a high degree of medical specialization in Egypt Medicine is practised among them on a plan of separation he writes each physician treats a single disorder and no more thus the country swarms with medical practitioners some undertaking to cure diseases of the eye others of the hand others a ain of the teeth others of the intestines and some those which are not local The fact that the next paragraph begins a discussion of funerals can hardly be taken as revealing the attitude of Herodotus toward specialization though his comment on the Egyptian practice does imply a contrast to Greek medicine

One sentence in the Hippocratic Oath— I will not cut persons laboring under the stone but will leave this to be done by men who are practitioners of this work —indicates some division of labor in the organization of Greek medicine But apart from the special tasks and skills of surgery the Hippocratic conception of the physician s work favors th practice of general medicine rather than specialization The man not the disease is to be treated and to treat him well the physician must examine the man as a whole not merely the organ or bodily part in which the disorder seems to be located The Hippocratic formula for getting a case history calls for an inquiry into the background of the individual s life his antecedents his occupation his temperament the patient s hab s regimen and pursuits his conversation manners taciturnity thoughts sleep or absence of sleep and sometimes his dreams what they are and when they occur his picking and scratching his tears From these as well as from the symptoms says Hippocrates we must form our judgment

The defense of general practice against specialization is part of Galen s argument with his adversaries Treatment of the disordered part as if it could be isolated from the living unity of the whole man is to Galen one of the deplorable consequences in medical practice of atomism or mechanism in medical theory

This issue is argued again and again in the history of medicine with each side pressing the advanta es in its favor Montaigne for example states the case for the specialist by analogy with the advantages of specialization in other arts As we have doublet and breeches makers distinct trades to clothe us and are so much the better fitted seeing that each of them meddles only with his own business and has less to

trouble his head with than the tailor who un dertakes them all and as in matter of diet great persons for their better convenience have cooks for the different offices so also as to the cure of our maladies With Freud and the development of a greater awareness of the psychological origin of many bodily dis orders, a new factor enters into the argument It tends to favor the general practitioner who from his acquaintance with the patient as a per son may be better able than the specialist to detect hidden psychological causes

THE CONCEPTION of disease is usually deter mined by the conception of health The ab normality is judged and measured as a devia tion from the norm Hippocrates uses the out ward appearance of man in a healthy condition as the standard for discerning the visible signs of illness The physician he says should ob serve first the countenance of the patient if it be like those of persons in health and more so if like itself for this is the best of all where as the most opposite to it is the worst He should also take note when he finds the patient reclining in a posture which resembles the nor mal disposition of the healthy body To find the whole body lying in a relaxed state is a more favorable sign than to find him upon his back with the hands neck and the legs ex tended

The history of medicine especially on the side of its science and theory if not so much with regard to its art and practice can be told in terms of refinements in the classification of diseases and progressive discovery of their spe cific causes both internal and external predis posing and exciting But the analysis of diseases according to their aetiology and by reference to the typical picture of the disease process leaves unanswered the general question about the nature of disease as a loss of health

Apart from its causes and its symptoms its modes and its patterns what is disease? This is the question of major speculative interest in the tradition of the great books The answers given have a certain uniformity in spite of the vary ing terms in which they are expressed

The humoural hypothesis of ancient medical theory for example conceives health as that condition of the body in which the physiolog cal elements are in a proper proportion or bal ance and in which the various parts or powers function harmoniously with one another As health is harmony or good order in the body so disease consists in imbalance and disharmony— an excess or defect with consequent dispropor tion of the elements or the disorder of con flicting bodily processes

In the *Timaeus* Plato first states this theory in terms of the four physical elements There are four natures out of which the body is com pacted earth and fire and water and air and the unnatural excess or defect of these or the change of any of them from its own natural place into another produces disorders and diseases He then considers the diseases which result from excess or defect of one or another of the four humours—blood phlegm black and yellow bile

The humoural hypothesis which Hippoc rates and Galen share with Plato and Aristotle undergoes many transformations in the history of medicine The four elements or humours are replaced by other physiological factors such as the hormones or internal secretions or the ele ments of modern biochemistry But constant throughout these changing formulations is the conception of health as an equilibrium and of disease as its loss through disorder and dispro portion

This broad conception of health and disease seems to apply to mental as well as bodily ills There is not only a basic continuity between Plato s and Freud s discussion of the bodily ori gin of mental disorders and the psychic origin of physical ailments but the Freudian emphasis upon conflict and disintegration in the neurotic character—milder forms of the schizophrenia or split personality which characterizes in sanity—also appeals to harmony as the princi ple of health The language of modern psych atry which refers to the integrated personal ity or the well balanced and adjusted indi vidual defines the norm or the ideal of mental health

The various kinds and degrees of mental dis order especially those which seem to be n t rely funct on l rather th n org n c represent abnormalities which though they differ in cause symptom and tendency have in com mon some excess or defect in the psychic struc

ture or some unresolved conflict in the nature of man Freud s psychoanaly tic method in the treatment of mental ills places psychotherapy in the main tradition of medical practice for in addition to insisting that the patient shall help to cure himself it is directed toward the resolution of conflict restoring the harmony which is health

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to For example in 4 Ho ier *Il ad* BK II [265–283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the pas sa e is in section d of page 12

PAGE SECTIONS When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in 53 JAM s *Psycholo y* 116a 119b the passage begi is in the upper half of pa e 116 and ends in the lower half of page 119 When the text is p i ted in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page. Fo e ample in 7 PLATO *Sympos m* 163b-164c the passage begins in the lower half f the left hand side of page 163 and ends in the upper half of the right hand side of page 164

AUTHOR s DIVISIONS One or more of the main divisions of a work (such as PART BK CH s CT) a e sometimes included in the reference line n mbers in brackets are given in certain cases *e g Iliad* BK II [265 283] 12d

Chapter 56 MEMORY AND IMAGINATION

INTRODUCTION

CONCERNING memory and imagination the tradition of western thought seems to be involved in less dispute than it is on other aspects of human and animal life There are, as we shall see, points of difficulty and debatable theories But these arise only within the framework of certain fundamental insights which are widely if not universally shared Here at least we can begin without having to deal with verbal ambiguities Unlike many of the words which are the traditional bearers of the great ideas memory and imagination have a constant core of meaning in almost everyone s discourse

It is understood that memory and imagination depend upon sense perception or upon previous experience Except for illusions of memory we do not remember objects we have never perceived or events in our own life such as emotions or desires that we have not experienced The imagination is not limited in the same way by prior experience for we can imagine things we have never perceived and may never be able to

Yet even when imagination outruns perception it draws upon experience for the materials it uses in its constructions It is possible to imagine a golden mountain or a purple cow though no such object has ever presented itself to perception But as Hume suggests the possibility of combining a familiar color and a familiar shape depends upon the availability of the separate images to be combined

When we think of a golden mountain Hume writes we only join two consistent ideas *gold* and *mountain* with which we were formerly acquainted All this creative power of the mind amounts to no more than the faculty of compounding transposing augmenting or diminishing the materials afforded us by the senses and experience A congenitally color blind man who lived entirely in a world of grays would not be able to imagine a golden mountain or a purple cow though he might be able to imagine things as unreal as these

Because of their dependence on sense-perception memory and imagination are usually regarded as belonging to the same general faculty as the external senses Not all writers however conceive of a generic power of sense which they then divide into the exterior senses such as sight hearing and touch and the interior senses such as memory and imagination Some like Hobbes treat imagination as nothing but decaying sense and use the word memory to express the decay and signify that the sense is fading old and past

The image whether it is a memory image or fancy free *re produces* or *re-presents* sensory material It may be less vivid less sharp in outline and less definite in detail than the sensation or perception from which it is derived But in one important respect the image does not differ from the original sense impression That is the respect in which ideas or concepts do differ from sense impressions—at least according to those who hold that ideas or concepts have a certain universality and abstractness which is not found in sensations and sensory images Those who like Berkeley and Hume call sensations or images ideas deny the existence of abstract ideas or universal notions precisely because they too agree that sense-impressions or sensory images are always particular in their content and meaning

THE FUNDAMENTAL controversy about what an idea is and the verbal confusion occasioned by the ambiguity of the word (which appears in the chapter on IDEA) do not seem to affect the understanding of the nature of images or their role in the activities of memory and imagina

tion As William James points out in discussing the blended or generic image which is somehow associated with abstract or universal meaning a blurred thing is just as particular as a sharp thing and the generic character of either sharp image or blurred image depends on its being felt *with its representative function* He speaks of this function as the mysterious *plus* the understood meaning but he denies the possibility of universal or abstract *images* whatever may be the truth about ideas which are not images at all Certainly those who deny the presence of anything abstract or universal in the understanding do so on the ground that the content of the mind is basically sensory whether the mind is perceiving or remembering imagining or thinking

The controversy about the nature of the mind does not seem to affect the conception of memory or imagination As neither is confused with sense perception so neither is confused with rational thought This remains the case whether the theory of mind looks upon the intellect as a faculty separate from the sensitive faculty (including memory and imagination) or conceives the understanding as a single faculty which is active in judgment and reasoning as well as in perceiving remembering and imagining

This and related issues are considered in the chapter on MIND Except for one point perhaps such issues can be ignored here Sensation is attributed to both animals and men—to all organisms which give evidence of having sense organs or some sort of sensitive apparatus Whether all animals even those which have the most rudimentary sensorium also have memory and imagination may be disputed but no one doubts that the higher animals with central nervous systems and brain structures resembling those of men can remember and imagine as well as perceive

All agree furthermore that memory and imagination require bodily organs though the assignment of these two functions to the brain as their organic seat is more uniformly a tenet of modern than of ancient physiology and can be more clearly expounded as the result of modern researches in neurology But the question whether the memory or imagination of men and other animals differs more than their bodies do elicits opposite answers from those who affirm that man alone has reason and those who deny that man has powers of knowing or thinking not possessed by other animals to some degree

Nevertheless if man alone is considered the nature of memory and imagination is clear The object remembered or imagined need not be physically present to the senses like the object perceived The object imagined need not be located in the past like the object remembered nor for that matter need it have any definite location in time and space It need have no actual existence It may be a mere possibility unlike the object which cannot be known without being known to exist As the object of memory is an event which no longer exists so *the object of imagination may be* something which has never existed and never will

Thus memory and imagination greatly enlarge the world of human experience Without them man would live in a confined and narrow present lacking past and future restricted to what happens to be actual out of the almost infinite possibilities of being Without memory and imagination man could be neither a poet nor an historian and unless he had an angelic sort of intellect which in no way depended on sense experience he would be impeded *in all* the work of science if memory and imagination did not extend the reach of his senses

THE PSYCHOLOGICAL analysis of memory usually divides it into a number of separate acts or phases Recollection presupposes the retention of the material to be recalled The ingenious experiments of Ebbinghaus that James reports —using the memorization of nonsense syllables to isolate the factors influencing memory— seem to show that retention is affected by the strength of the original associations *But re*tention is also affected by the interval between the time of learning and the time of revival The amount of forgetting seems to be a function of two separate factors the force with which the material to be recalled is originally committed to memory and the lapse of time

That retention is not the same as recall may be seen from Ebbinghaus experimental discovery of the fact that forgetting is never com

plete Material which lies below the threshold of recall is nevertheless retained and manifests its presence by its effect on attempts to relearn the material which *appears* to have been for gotten

Nothing can be utterly forgotten if as Augustine suggests what seems to be forgotten remains in the memory He considers the effort *men make to remember a forgotten name* Where does that name come back from he asks except from the memory? For even when it is through being reminded of some thing else that we recognize someone s name it is still by memory that we do it for we do not hold it as some new thing learned but by mem ory we are sure that this is what the name was But were the name utterly blotted out of mind Augustine argues we should not re member it even if we were reminded For if we had utterly forgotten it we should not even be able to think of looking for it

Freud cons ders forgetting from another *point of view He describes the psychoanalytic* method at its inception as a talking cure in volving efforts in reminiscence The things which we have put out of mind he claims are hindered from becoming conscious and forced to remain in the unconscious by some sort of force He calls this repression Freud ob served that it occurred when a wish had been aroused which was in sharp opposition to the other desires of the individual and was not capable of being reconciled with the ethical aesthetic and personal pretensions of the pa tient s personality The end of this inner struggle was the repression of the idea which presented itself *to consciousness as the bearer of* this irreconcilable wish This was repressed from consciousness and forgotten

On this view things which have been put out of mind because we find them unpleasant to contemplate things which are repressed in order to avoid conflict are not forgotten when they cannot be consciously remembered Nor a e they below the threshold of recall in the sense that our retention of them has been so weakened by time that no effort at recollection can revive them On the contrary they may be capable of quite vivid rev val when the emo tional obstacles to recollect on are removed Freud applies his theory of the obliviscence of the disagreeable to such everyday occurrences as the forgetting of familiar names as well as to the repression of memories connected with the emotional traumas of early life

Recollection is distinct not only from reten tion but also from recognition The illusion known as *deja vu* consists in the experience of intense familiarity with a place or scene that so *far as one can recall* has *never* been witnessed before In contrast normal recognition depends upon previous acquaintance with the object being cognized again *i e re-cognized* The fact noted by many observers that recognition may or may not be ccompanied by recollection of the previous circumstances indicates the sep aration of recall and recognition as acts of memory Whereas recollection is remembering through the recall of images recognition con sists in remembering at the very moment of perceiving Both however depend upon what seems to be memory s fundamental act —retention

WITH REGARD TO retention there are two prob lems which have been the subject of inquiry throughout the whole tradition The first con cerns what is usually called the association of ideas From Aristotle through Hobbes and Hume to James and Freud there have been various formulations of the laws of association and various interpretations of what such la s signify about the mind Ebbinghaus for ex ample used nonsense syllables in order to meas ure the effect upon retention of the associations formed by repetition of a series of sounds All meaning had been removed in order to avoid *the influence upon recollection of associations* resulting from meaningful connections of the sort wh ch exists among ordinary words The repetition of nonsense syllables in pairs or series illustrates association by contiguity or succes sion According to most writers the elements of experience become associated through other modes of relation also such as their s milarity or contrast with one another in any significant respect

It is not the association itself which is re membered Rather it is throu h the a sociation of one part of experience with another that memory seems to wo k one particular tending to recall others with which it has been asso

ciated in one or more ways Recollection seems to occur through activating connections which have been formed and retained The modern differentiation of controlled and free association indicates two ways in which this can happen—either by a purposeful pursuit of the past or by the apparently chance recall of one thing by another The ancients make a parallel distinction between reminiscence and reverie The former is a process in which recollection resembles reasoning in proceeding step by step through a series of related terms the latter is more like daydreaming or spontaneous fantasy

The second problem can be stated perhaps as the mystery of retention itself In describing the capacity of the memory to hold the innumerable things which are not now in mind but can be recalled the ancients speak of memory as the storehouse of images Every variety of thing which can be perceived can be stored up in the memory says Augustine and called up at my pleasure When I speak of this or that he goes on the images of all the things I mention are at hand from the same storehouse of memory and if the images were not there I could not so much as speak of the things The things themselve are not brought into the memory it is only their images which are seized with such marvellous speed and stored away marvellously as if in cabinets and as marvellously brought forth again when we remember

The marvel of memory deepens into a mystery when we ask what the metaphor of the storehouse literally means Where actually are the images when they are not actually in mind? If an image is by its nature an act of consciousness hereby we apprehend objects not immediately present to our senses how do images exist outside of consciousness during intervals when they do not function in remembering imagining o other acts of knowing? Their return to consciousness seems to imply that they have been retained but where and how is the problem not solved by the metaphor of things stored a ay in a capacious barn

The physical storehouse does not require any fundamental transformation in the being of the things it holds between periods when they are actually in use The memory does Th s problem of the nature and causes of retention Wil liam James seems to think can be solved only in terms of the retentive power of nervous tissue—what he calls physiological retentiveness —though in the view of others the problem becomes no easier (and may even be more complicated) when it is transferred from mind to matter On either view there seems to be no question that changes in the brain are somehow causally connected with the activity of memory and imagination especially retention and recall Aquinas for example observes that the imagination and memory may be hindered by a lesion of the corporeal organ or by lethargy an observation many times extended by more recent investigations of the brain pathology underlying amnesia and aphasia

JAMES TREATMENT of retention as somehow based on pathways traced in the brain with recall the result of a retracing of these paths tends to emphasize the affinity between memory and habit His theory discussed in the chapter on HABIT that the plasticity of matter certainly living matter underlies learnin or habit formation while the inertia or retentiveness of matter especially the neural matter of the brain explains memory or the persistence of habits during periods of disuse seems almost to identify habit and memory Ice skating after many years of absence from the sport is as much remembering how to ice skate as reciting a poem committed to memory in youth is the exercise of an old habit

Not all conceptions of habit and memory permit thi fusion of the two—or even their affinity as related aspects of the same phenomenon Aquinas for example restricts memory to an act of knowledge The performan e popularly called reciting from memory would not be for him an act of memory though it might involve memory if the recitation were a companied by knowledge of the time or place and occasion when the poem was first learned Such knowledge would be a memory but the recitation itself would not be any more than ice skating is These performances represent the exercise of habits of skill or art

In view of this Aquinas raises the question whether the act of knowledge of the sort involved in recon idering a geometric proof

learned at some earlier moment and now re-called to mind is an act of memory The knowledge of the proof which is retained by the intellect during periods when it is not actually exercised he would call an intellectual habit or habit of knowledge But should the recollection of this retained knowledge or the activation of this intellectual habit also be called an act of memory? Aquinas answers No on the ground that no reference to the past need be involved in reworking a geometrical problem solved at some earlier time But if the individual also happens to recall *when* he first solved the problem that is another matter Even so Aquinas claims that if in the notion of memory we include its object as something past then the memory is not in the intellectual but only in the sensitive part The intellect is said to remember only in the sense of recalling a truth retained by habit and not in the sense that it understands the past as something here and now

Memory is considered in still another way in relation to speculative truths about scientific or philosophical matters The question is one of the origin of such knowledge In the usual conception of memory as knowledge of past particulars one traditional view found in Aristotle holds that out of sense perception comes to be what we call memory and out of frequently repeated memories of the same thing develops experience —the generalized experience which gives rise to induction and the apprehension of the universal But in the tradition of the great books we also find a more radical and perhaps less familiar conception of memory as the chief source of knowledge

This is Plato s doctrine of reminiscence in which all learning is a kind of remembering of knowledge already present in the soul All teaching takes the form of helping the learner to recollect things he may not be aware he knows by reminding him through a process of questioning which awakens the knowledge already latent in him.

In the *Meno* Meno asks Socrates What do you mean by saying that we do not learn and that what we call learning is only a process of recollection? Socrates undertakes to show Meno what he means by taking a slave boy who appears not to know the solution of a certain geometrical problem and merely by questioning him without ever giving him a single answer getting the slave boy to find the right solution for himself Meno assures Socrates that the slave boy had never been taught geometry Since the boy was not told the answer he must have always known it and needed only some reminding to remember what he knew Socrates suggests the explanation that the boy s soul always possessed this knowledge bringing it from another life

Before he undertook the demonstration with the slave boy Socrates had proposed this hypothesis The soul being immortal and having been born again many times and having seen all things that exist has knowledge of them all and it is no wonder that it should be able to call to remembrance all that it ever knew about virtue and about everything for as all nature is akin and the soul has learned all things there is no difficulty in her eliciting or as men say learning out of a single recollection all the rest if a man is strenuous and does not faint for all enquiry and all learning is but recollection

Though he differs from Plato in his conception of the soul and the origin of the knowledge which it innately possesses Augustine seems to hold a similar view As he examines his own memory it appears to contain much that has not been implanted there by sense experience Certain things referred to by words he understands he says I never reached with any sense of my body nor ever discerned them otherwise than in my mind yet in my memory have I laid up not their images but themselves How they entered into me let them say if they can for I have gone over all the avenues of my flesh but cannot find by which they entered If the seeds of learning are in the soul at its creation memory can draw from these seminal reasons the full fruit of knowledge

THE DOCTRINE OF reminiscence changes the meaning of both learning and memory at the same time When learning consists in remembering knowledge not acquired in this life then the activity of memory cannot be as it is usually conceived a recollection of knowledge previously acquired in this life by learning In order to understand a doctrine in which famil

iar meanings are so profoundly altered it is perhaps necessary to understand the problem it tries to solve

That problem exists only for those who make an absolute distinction between particular sensory images and universal ideas or abstract concepts Those who like Hobbes Berkeley or Hume deny universals or abstractions as any part of the mind s content see no special problem in the origin of that part of the mind s content which is not received as sense impressions The original impressions are somehow externally caused and all the rest of the mind s content—its images and memories and all constructions of the sort Locke calls complex ideas —then arise by natural derivation from the original sense impressions

But those who on the contrary maintain that ideas or concepts are *not* images of any sort cannot avoid the problem of how the mind comes by its ideas One solution of this problem attributes existence to ideas as intelligible objects and attributes to the mind the power to apprehend them by direct intuition just as the senses directly apprehend sensible objects But if ideas whether or not they exist outside the mind cannot be apprehended intuitively then what is the origin of the ideas whereby the mind understands intelligible objects?

To this question the doctrine of reminiscence is one answer Another answer is the doctrine of abstraction as formulated by Aristotle and Aquinas Locke and James also seem to recognize a distinction in kind between abstractions and other mental content but they do not appear to find any need for a special power to perform the act of abstracting general ideas or universal concepts from the sensory particulars of perception and imagination Aquinas however thinks that a special faculty called the active intellect must be postulated to account for the mind s possession of the ideas or concepts whereby it actually understands what it cannot perceive or imagine

These theories are considered in the chapters on Idea and Mind But just as the doctrine of reminiscence is relevant here for its bearing on the discussion of memory so the doctrine of abstraction which posits an active intellect is relevant to the discussion of imagination

Imagination writes Aristotle is different from either perceiving or discursive thinking though it is not found apart from sensation or judgment without it That this activity is not the same kind of thinking as judgment is obvious For imagining lies within our own power whenever we wish (e g we can call up a picture as in the practice of mnemonics by the use of mental images) but in forming opinions we are not free we cannot escape the alternatives of falsehood or truth

The point is not that images cannot be false They frequently are as (according to Aristotle) sensations never are But the falsity of our imaginations involves a judgment that things really are as we imagine them to be If imagination is not accompanied by judgment the question of truth or falsity does not arise for in pure imagination we are not concerned with the way things actually exist but with the possible i e the imaginary rather than the real Everyone knows the difference says James between imagining a thing and believing in its existence

Conceiving imagination as an activity depending upon the prior activity of the senses, Aristotle holds that imagination is incapable of existing apart from sensation In this he does not differ from other psychologists But he also holds that rational thought which for him is quite distinct from imagination cannot exist apart from imagination "To the thinking soul images serve as if they were the contents of perception That is the why the soul never thinks without an image

Aristotle is here saying more than that a special faculty of mind or intellect abstracts the universal form—or what Aquinas calls the intelligible species —from the sensory matter of the image or what Aquinas calls the phantasm Aristotle is, in addition insisting that the act of understanding is always accompanied by imaginative activity The kind of thinking which depends upon the abstraction of ideas from imagery also depends upon the presence of images when the thinking takes place The faculty of thinking says Aristotle thinks the forms in the images or as Aquinas expresses it "for the intellect to understand actually not only when it acquires new knowledge but also when it uses knowledge already acquired there is need for the act of imagination It must of

necessity turn to the phantasms in order to perceive the universal nature existing in the individual The cooperation of the imagination with the intellect is shown, furthermore by the fact that when the act of imagination is hindered by a lesion of the corporeal organ we see that a man is hindered from understanding actually even those things of which he had a previous knowledge

Augustine on the contrary refers to things which we know within ourselves without images When we consider numbers for example it is not their images which are in [our] memory but themselves The question of imageless thou ht—of thinking abstractly without the use of images—seems to be peculiarly insistent in sciences like mathematics metaphysics and theology in which the conceivable may not be imaginable The objects peculiar to these sciences seem to require the scientist to do without imagery or as Aquinas says to rise above his imagination

This may be true even in physics Atoms according to Lucretius are conceivable but they are no more imaginable than they are perceptible If we need images to think of them we must use imagery in a metaphorical way picturing the atom as the smallest particle imaginable—only more so! To the objection that there must be imageless thought if we can think of in orporeal beings of which there can be no images or phantasms Aquinas repl es that we do so by comparison with sensible bodies of which there are phantasms

ARISTOTLE S THEORY that the operations of thinking are always dependent on (though not reducible to) acts of imagination does not imply that imagination is always accompanied by abstract or rational thought Normally human thinking and knowing is a work which combines both sense and intellect both reason and imagination but sometimes even in man imagination may be active without judgment or reason ng Brute animals according to Aristotle are largely guided by their imag nations because of the non-existence in them of mind But when imaginat on takes the place of thought in men it is because of the temporary eclipse of their minds by passion or disease or sleep

Dreaming seems to be the striking case of imagination divorced from reason s judgment or control It has long been suspected that animals also dream but the question whether they can distinguish their dreams from their waking perceptions may prove forever unanswerable Philosophers and psychologists have however asked themselves whether there is any way of being certain of the difference between waking thought and the phantasmagoria of dreams

Descartes for example asks How do we know that the thoughts that come in dreams are more false than those that we have when we are awake seeing that often enough the former are not less lively and vivid than the latter? It seems to him that there are no certain indications by which we may clearly distinguish wakefulness from sleep Even as he writes these words he can almost persuade himself that he is dreaming Yet he does find one probable sign whereby to tell dreaming from waking Our memory he observes can never connect our dreams with one another or with the whole course of our lives as it unites events which happen to us while we are awake

Aquinas finds other evidences of the difference When a man is fully asleep he does not dream at all for his imagination is inactive as well as his senses and his mind But as sleep passes gradually into waking his faculties begin to act again not merely the imagination but the reason also so that a man may judge that what he sees is a dream dis erning as it were between things and their images Nevertheless the common sense remains partly suspended and therefore although it discriminates some images from reality yet it is always deceived in some particular Even while a man is asleep his sense and imagination may be to some extent free and similarly the judgment of his intellect may be unfettered though not entirely Consequently if a man syllogizes while asleep when he wakes up he invariably recognizes a flaw in some respect

APART FROM QUESTIONS of truth and falsity or reality and illusion the nature and causes of dreaming are perennial themes in the trad t on of western thought As different suppositions are made concern ng the cause of dreams so different interpretations are given of their content

When it is supposed that the dream is inspired by the gods or is a divine visitation it becomes a medium of divination or prophecy—a way of foretelling the future or of knowing what the gods intend in general or for the guidance of some particular man In the great books of ancient poetry and history and in the Old Testament as well dreams like oracles are interpreted as supernatural portents and figure as one of the major sources of prophecy Aristotle discounts both the fulfillment of dreams and their non fulfillment for coincidences do not occur according to any universal or general law Regarding prophetic dreams as mere coincidences he does not find it surprising that many dreams have no fulfillment From the fact that certain of the lower animals also dream he thinks it may be concluded that dreams are not sent by God nor are they designed for the purpose of revealing the future

Instead Aristotle proposes natural causes for the origin of dreams Slight stimulations of the sense organs awaken the dream process and determine its content Dreamers fancy that they are affected by thunder and lightning when in fact there are only faint ringings in their ears or that they are walking through fire and feeling intense heat when there is only a slight warmth affecting certain parts of the body Lucretius similarly explains dreams by natural causes but attributes their content to events which have dominated the thought of waking life

On whatever things we have before spent much time he writes so that the mind was more strained in the task than is its wont in our sleep we seem mostly to traffic in the same things lawyers think that they plead their cases and confront law with law generals that they fight and engage in battles sailors that they pass a life of conflict waged with winds This is true even of animals Strong horses when their limbs are lain to rest Lucretius continues yet sweat in their sleep and pant forever and strain every nerve as though for victory

And hunters dogs often in their soft sleep yet suddenly toss their legs and all at once give tongue and again and again sniff the air with their nostrils as if they had found and were following the tracks of wild beasts

IN THE TRADITION of the great books modern writers like their ancient forebears appeal thus to sensation and memory as the natural causes of the origin and content of dreams But except for daydreams or waking fantasy they do not observe that dreaming may be even more profoundly a product of desire If Freud s extraordinary insight on this point is supported by all the evidences he assembles in his great work the *Interpretation of Dreams* then the lateness of this discovery may be thought even more extraordinary than the theory itself

The theory is not simply that the content of dreams is determined by desires When Oedipus tells Jocasta of his fear that in taking her to wife he has unwittingly married his mother she tells him to fear not for many men ere now have so fared in dreams also If that is so then such dreams do not call for the interpretation which Freud gives If there are men who suffer from what Freud calls the Oedipus complex involving repressed incestuous desires then the expression of those desires in dreaming will not take the form of imagining them to be actually fulfilled

On the contrary Freud s theory of dream symbolism holds that the dream as remembered is not the real thing at all but a distorted substitute Beneath what he calls the manifest dream content —the actual moving images which occupy the dreaming consciousness—lie the latent dream thoughts which are distorted in the actual dream This distortion is due to the activities of censorship directed against the unacceptable unconscious wish impulses invariably of an objectionable nature offensive from the ethical aesthetic or social point of view things about which we do not dare to think at all or think of only with abhorrence The repressed desires or wishes the loves or fears which the dreamer refuses to acknowledge consciously must therefore appear in dreams in a disguised form The imagery of dreams seems to Freud to be a kind of language in which the repressed materials of thought and feeling employ a special symbolism to express what the moral censor will not permit us to express in the ordinary language of our conscious thought or social conversation

As ordinary language contains symbols conventionally agreed upon so Freud finds that

the recurrence again and again of certain images in the dreams of neurotic patients and of normal persons as well gives them the character of conventional symbols The number of things which are represented symbolically in dreams is according to Freud not great They are he says the human body as a whole parents children brothers and sisters birth death nakedness—and one thing more The only typical that is to say regularly occurring representation of the human form as a whole is that of a *house* When the walls are quite smooth the house means a man when there are ledges and balconies which can be caught hold of a woman Parents appear in dreams as *emperor* and *empress* *king* and *queen* or other exalted personages Children and brothers are less tenderly treated being symbolized by little *animals* or *vermin* Birth is almost invariably represented by some reference to *water*

For dying we have setting out upon a *journey* or *travelling* by train *Clothes* and *uniforms* stand for nakedness The one thing more which Freud mentions in his enumeration comprises the sexual organs and acts In contrast to all the others these he says are represented by a remarkably rich symbolism

An overwhelming majority of symbols in dreams are sexual symbols

Freud points out why it would be a mistake to treat dream symbols like the words of an ordinary language Their object is not to tell anyone anything they are not a means of communication on the contrary it is important to them not to be understood Wresting their secret from such symbols is a remarkable achievement Aristotle s remark which Freud quotes that the most skilful interpreter of dreams is he who has the faculty of observing resemblances seems to be born out in the Freudian method of discovering the latent content of the dream symbolism But Freud s therapeutic use of what can thus be discovered makes the psychoanalytic method a thing totally unanticipated by any of his predecessors

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in hea y type which are the volume and page n mbers of the passa es referred to For example in 4 Ho ɪᴇʀ *Iliad* ʙᴋ ɪɪ [265 283] 12d the number 4 is the number of the volume in the set the number 12d ind cates that the pas sage is in section d of page 12

PAGE SECTIONS When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the l wer half of page 119 When the text is printed in two columns the letters a nd b efer to the upper and lo ver hal es of the left ha d side of th p ge the lette s c and d to the upper and lower halves of the right hand s de of the page. F r example n 7 PLATO *Symposium* 163b-164c the passage begins in the lo ver half of the left hand side of page 163 and ends in the upper half of th r ght hand side of page 164

Chapter 57 METAPHYSICS

INTRODUCTION

IN this chapter as in MATHEMATICS we must distinguish controversies about the science we are considering from controversies in it But here the situation is complicated by many ambiguities In the tradition of western thought the name of science has never been denied to mathematics no matter how its subject matter has been defined or what conception of science has prevailed But controversies about metaphysics often begin in modern times at least by questioning our right to use the word science when we speak of metaphysical inquiry or speculation The challenge usually implies that metaphysics cannot be regarded as a body of valid knowledge because the peculiar objects it has chosen to investigate are not susceptible to scientific inquiry

If experimentation were the *sine qua non* of scientific knowledge it would follow of course that a discipline which could not perform experiments or even less rigorous types of empirical research could not be called a science But by that standard mathematics would also be ruled out It does not seem to be the case however that mathematics and metaphysics stand or fall together

Hume for example admits the one and excludes the other If we are persuaded of his principles concerning science what havoc he says must we make when we run over our libraries If we take in our hand any volume of divinity or school metaphysics for instance let us ask *Does it contain any abstract reasoning concerning quantity or number?* No *Does it contain any experimental reasoning concerning matter of fact and existence?* No Commit it then to the flames for it can contain nothing but sophistry and illusion

Nor does Kant make experimentation or empirical research indispensable to valid and certain knowledge On the contrary pure as opposed to empirical physics is for him like mathematics in having the superior status of *a priori* knowledge They are both sciences in the highest sense of the term because they consist of valid synthetic judgments *a priori* Kant therefore does not exclude metaphysics from the ranks of science because he thinks that metaphysic according to its proper aim consists merely of synthetic propositions *a priori* Not the method of metaphysics nor the form of its propositions but the character of its objects seems to be the cause of its frustration, reducing it to what Kant calls an illusory dialectic rather than a valid science

It might be supposed that those who take the opposite view—that metaphysics *is* a science even perhaps the highest of the sciences—would agree in defining its objects or the scope of its inquiry This does not seem to be the case any more than it seems to be true that all those who criticize metaphysics conceive its subject matter in the same way

Following what he takes to be the traditional conception of metaphysics in the mediaeval schools which appears to him to be continued in the writings of Descartes Leibnitz and Wolff Kant says that metaphysic has for the proper object of its inquiries only three grand ideas God Freedom and Immortality This also seems to be at least part of what Hume has in mind when he refers to school metaphysics and associates it with divinity by which he means theology natural or sacred Yet we find William James saying that Hume is at bottom as much of a metaphysician as Thomas Aquinas because he is engaged in speculations concerning the relation or lack of relation the identity or lack of identity in the discrete elements of immediate experience Here the quest on seems to be not about God freedom and immortality but about the existence of enduring

substances underlying all perceptible qualities or about a fixed order of reality behind the sequence of phenomena in experience According to James the whole question of interaction and influence between things is a metaphysical question and cannot be discussed at all by those who are unwilling to go into matters thoroughly

In the Preface to his *Principles of Psychology* James declares his plan to limit his own inquiries to what can be known by the empirical methods of the natural sciences Psychology like physics must assume certain data The discussion of these assumptions he says is called metaphysics and falls outside the province of this book The data assumed by psychology just like those assumed by physics and the other natural sciences must sometime be overhauled The effort to overhaul them clearly and thoroughly is metaphysics but metaphysics can only perform her task well when distinctly conscious of its great extent The implication seems to be not that metaphysics is impossible but rather that metaphysics as James conceives it does not yet exist in any mature or satisfactory development Only a metaphysics alive to the weight of her task he writes can hope to be successful That will perhaps be centuries hence

WE CANNOT FULLY explore the issue concerning the objects of metaphysics without observing that other names are used in the tradition of the great books to designate the discipline which rightly or wrongly claims to be the highest human science The Greeks initiated the conception of a discipline which should be preeminent because it deals with first principles and highest causes It not only searches for wisdom about the ultimate realities it also lays the foundations for all other sciences But the Greeks do not have one name for this discipline nor is metaphysics even among the various names they use

Aristotle whose *Metaphysics* is the first great book to have this word in its title never uses the word to refer to the science which he is trying to define and establish In the opening chapters he speaks of it under the name of wisdom for all men suppose what is called Wisdom to deal with the first causes and the principles of all things There are other theoretical sciences such as physics and mathematics which investigate causes or deal with principles but they do not reach to the highest causes or first principles nor do they take all things in their most universal aspect as the object of their inquiry

Though physics also is a kind of Wisdom says Aristotle it is not the first kind and elsewhere he says that both physics and mathematics must be classed as *parts* of Wisdom Physics deals only with material things in motion and the mathematician investigates abstractions —objects which except as abstracted cannot exist apart from matter and motion If there is something which is eternal and immovable and separated from matter clearly the knowledge of it belongs to a theoretical science —not however to physics nor to mathematics but to a science prior to both It is that science which is the highest part of wisdom

Aristotle gives two names to the supreme form of human wisdom or the highest of the theoretical sciences He denominates it both from the position it occupies in relation to all other disciplines and also in terms of the kind of substance which it alone investigates If there is no substance other than those which are formed by nature natural science (*i e* physics) will be the first science but if there is an immovable substance the science of this must be prior and must be first philosophy But this highest science also deserves to be called theology as well as first philosophy There are Aristotle says three theoretical philosophies mathematics physics and what we may call theology since it is obvious that if the divine is present anywhere it is present in things of this sort *i e* the eternal immutable immaterial

THERE IS STILL another name for the highest speculative discipline in the Greek conception of the order of the sciences Dialectic is the name which Plato gives to the search for first principles and for the knowledge of the most intelligible realities As appears in the chapter on DIALECTIC Aristotle contrasts the dialectician and the philosopher as respectively concerned with opinion and knowledge but Plato regards the dialectician as preeminently the

philosopher Not only does dialectic belong to the realm of knowledge rather than opinion but in the realm of knowledge mathematics occupies the lower dialectic the upper part The mathematical sciences build upon hypotheses which they do not and cannot establish Dialectic uses hypotheses only as steps and points of departure into a world which is above hypotheses in order that she may soar beyond them to the first principle of the whole and by successive steps she descends again without the aid of any sensible object from ideas through ideas and in ideas she ends

Despite all the relevant differences between Plato and Aristotle concerning being and becoming reason and sense the intelligible and the sensible it seems possible to compare the knowledge which Plato calls dialectic with what Aristotle calls first philosophy or theology

Both for example proceed from first principles and establish the foundations of the inferior sciences On its downward path dialectic according to Plato brings the light of reason to bear on the understanding of the hypotheses which are the principles of mathematics Though Aristotle thinks that mathematics rests on axioms or self evident truths he also says that it must be the business of first philosophy to examine the principles of mathematics because the mathematician only uses them in a special application without investigating their general truth Furthermore the question concerning how the objects of mathematics exist is a question for the first philosopher not the mathematician

In the *Sophist* Plato to illustrate the difference between the sophist and the dialectician or philosopher develops an analysis of such terms as being and non being true and false same and other one and many rest and motion These it seems are the fundamental concepts in the philosopher s knowledge of the ultimate reality But these are also the fundamental concepts in Aristotle s *Metaphysics* In the mediaeval period when metaphysics generally replaces dialectic as the name for the first philosophy the so-called transcendental terms—such as *being essence other one true good*—are treated as the basic metaphysical concepts and what is characteristic of them as abstractions helps to characterize the nature of metaphysics as a science

The word metaphysics comes into use as a result of the title supposedly given by the Alexandrian librarians to the work in which Aristotle treats the problems of the first philosophy The word is short for the books which come after the books on physics Plotinus uses the word and connects it with the Platonic meaning of dialectic In the training of the metaphysician he says dialectic is the ultimate study

Dialectic according to Plotinus is the method or discipline that brings with it the power of pronouncing with final truth upon the nature and relation of things—what each is how it differs from others what common quality all have to what kind each belongs and in what rank each stands in its kind and whether its bein is real being and how many beings there are and how many non beings to be distinguished from beings But we must not think of dialectic Plotinus declares as the mere tool of the metaphysician It goes beyond metaphysics as vision or contemplative wisdom goes beyond discursive reasoning and demonstration It leaves to another science all that coil of premises and conclusions called the art of reasoning

The question which Plotinus raises—whether there is a higher science or form of knowledge than metaphysics—is naturally considered by the great Christian theologians In part their answer resembles that of Plotinus in part it differs Where Plotinus speaks of dialectic as the most precious part of philosophy because it transcends reasoning and argument and reaches the sort of immediate apprehension of reality which cannot be expressed in words theologians recognize the supremacy of mystical knowledge—a foretaste in this life of what the vision of God will be like in the life to come But unlike Plotinus they do not think such knowledge here or hereafter is natural wisdom Rather it is supernatural knowledge the divine gift to man of a contemplative wisdom to which his nature cannot attain by its own unaided powers

The subordination of metaphysical science to knowledge which is both supernatural and non-scientific (*i e* neither discursive nor analytical nor demonstrative) is considered in the chap-

ters on THEOLOGY and WISDOM Another subordination of metaphysics considered there also must be mentioned here as well That is the subordination of metaphysics to theology Both metaphysics and theology may be conceived as sciences which are engaged in reasoning and argument and in trying to demonstrate conclusions from principles But one is merely a human science working with the principles of reason whereas the other is what Aquinas calls sacred doctrine in order to signify that its principles are articles of religious faith

In the hierarchy of human sciences metaphysics remains supreme—the first philosophy It suffers only by comparison with theology insofar as the latter rests upon divine revelation and since it enjoys the certainty of faith escapes the insecurity of reason Though metaphysics and theology differ in their principles and somewhat in their methods they do not differ entirely in their subject matter Both for example may treat of God and of the existence of immaterial and imperishable beings Aquinas therefore must face the objection that there is no need for any knowledge in addition to metaphysics because everything that is is treated of in *philosophical science—even God* Himself in that part of philosophy called theology or the divine science by Aristotle To this he replies by giving two reasons for sacred theology

It is necessary he says for the salvation of man that certain truths which exceed human reason should be made known to him by divine revelation Even as regards those truths about God which human reason could have discovered it was necessary that man should be taught by a divine revelation because the truth about God such as reason could discover would only be known by a few and that after a long time and with the admixture of many errors Furthermore he continues there is no reason why those things which may be learnt from philosophical science so far as they can be known by natural reason may not also be taught us by another science so far as they fall within revelation Hence the theology included in sacred doctrine differs in kind from that theology which is a part of philosophy

These two kinds of theology are traditionally distinguished as natural and sacred When Francis Bacon divides the sciences into theology and *philosophy* he adds that *in the former* we do not include natural theology Natural theology is the divine part of philosophy yet it is clearly distinct from sacred theology or what Bacon calls inspired divinity

This distinction in whatever language it is made raises two problems The first concerns the relation of natural to sacred theology especially with regard to the scope of natural theology and the precise nature of its independence of sacred doctrine On this question there seems to be considerable difference between such writers as Augustine and Aquinas or Bacon and Descartes As already noted the various issues involved are reserved for discussion in the chapter on THEOLOGY The second problem is directly pertinent to metaphysics alone The question is whether metaphysics and natural theology are identical in subject matter or scope or whether natural theology is only a part of metaphysics

Aristotle seems to answer this question when he suggests that first philosophy and theology are interchangeable designations for the highest branch of speculative knowledge To *the extent that he declares this science to be an* inquiry concerning the existence and nature of immaterial and imperishable substances his definition of the object of metaphysics would seem to justify the title of theology

Descartes who also separates metaphysics from physics by reference to the immateriality and materiality of the substances which are their objects even more explicitly seems to give the whole of metaphysics a theological character In the Preface to his *Meditations on the First Philosophy* he says that he is concerned to treat of God and the human soul for as he explains to the professors of Sacred Theology of the Sorbonne I have always considered that the two questions respecting God and the soul were the chief of those that ought to be demonstrated by philosophical rather than theological argument

Though he adds the freedom of the human will to the existence of God and the immortality of the soul Kant s definition of the objects of metaphysical speculation similarly makes metaphysics an inquiry into things which lie outside the realm of physics and associates it

with the traditional subject matter of theology at least in the sense that here reason tries to prove propositions which are the main tenets of religious faith In his Preface to the first edition of the *Critique of Pure Reason* Kant remarks that when reason finds itself compelled to have recourse to principles which transcend the region of experience it falls into confusion and contradictions The arena of these endless contests is called Metaphysic

IF NOTHING IMMATERIAL exists if there are no beings apart from the changing things of sense experience or if although such things exist they cannot be known by reason proceeding in the manner of speculative science does it follow that metaphysics must also be denied existence at least as a speculative science? The answer seems to be clear If the declared objects of a science do not exist or if those objects are unknowable by the methods which that science proposes to follow then it seems difficult to defend its claims to be a valid science against those who challenge them The controversy over the validity of metaphysics would thus appear to turn on the truth or falsity of the two ifs just mentioned

But the matter cannot be so resolved if natural theology does not exhaust the whole of metaphysics that is if metaphysics considers objects other than the immaterial and if it inquires into their nature rather than their existence Aristotle s definition of the subject matter of the first philosophy seems to contain an alternative conception of metaphysics one which may be quite consistent with the conception of it as theology but which however gives it problems to solve in the realm of physical things

There is a science Aristotle writes which investigates being as being and the attributes which belong to being in virtue of its own nature This definition of the first philosophy seems to differentiate it from mathematics and physics as sharply as the other definition in terms of immaterial and imperishable substances The other sciences according to Aristotle do not treat of being *qua* being universally The properties of anything which is in so far as it has being and the contraries in it *qua* being it is the business of no other science to investigate for to physics one would assign the study of things not *qua* being but rather *qua* sharing in movement and mathematics is concerned with the attributes of things *insofar as they are quantitative and continuous* These sciences mark off some particular kind of being some genus and inquire into this but not being simply nor *qua* being Similarly these sciences omit the question whether the genus with which they deal exists or does not exist *because it belongs to the same kind of thinking to show what it is* and that it is

Only the first philosophy does not inquire about particular subjects in so far as each has some attribute or other but speculates about being *in so far as each particular thing is* Its subject matter then includes *all* existing things as existing and involves not only the question how anything which exists exists (i e the properties of being) but also the question whether certain things whose existence can be questioned do in fact exist Whatever truths hold good for all things *qua* being—such as the principle that the same thing cannot both be and not be in the same respect at the same time —belong to the first philosophy even though as in this case Aristotle points out the law of contradiction may also belong to logic as the principle of demonstration

THIS BROADER CONCEPTION of the first philosophy explains as its restriction to natural theology could not explain why the central books in Aristotle s *Metaphysics* treat of sensible physical substances their nature as substances the distinction between substance and accident form and matter potentiality and actuality as principles of the composite nature of changing substances and the properties of such existences in virtue of their having being e g their unity and divisibility their sameness and otherness

Aristotle does not inquire whether such substances exist He seems to take their existence as unquestionable for he frequently refers to physical things as the readily recognized substances But in addition to the question how sensible substances exist there are such questions as whether there are or are not any besides sensible substances and whether there

s a substance capable of separate existence from sensible substances and if so why and how These latter questions lead to the concluding books of the *Metaphysics* which inquire into the existence of the non sensible the immaterial the immutable If Aristotle s theology begins here then theology is only a part—the crowning part perhaps—of a larger science whose object is not a special realm of being but all of being

Hobbes and Bacon go further than Aristotle in the direction of opposing the identification of metaphysics with theology Where Aristotle seems to admit theological subject matter as a part of the first philosophy they exclude it entirely

Hobbes does not use the word metaphysics in his own classification of the sciences he employs it only as a term of derogation to refer to scholastic doctrines which he repudiates. His own classification makes *philosophia prima* that branch of natural philosophy which is prior to the mathematical and mechanical sciences The latter deal with determinate quantity and motion. The antecedent science deals with quantity and motion *indeterminate* These being the principles or first foundation of philosophy the science which deals with them is called *Philosophia Prima*

Bacon distinguishes between first philosophy and metaphysics and between metaphysics and natural theology First philosophy he says is the common parent of sciences It is concerned with axioms not peculiar to any science but common to a number of them and also with the adventitious or transcendental condition of things such as little much like different possible impossible entity nonentity etc Natural theology which is the divine part of philosophy because it inquires about God unity goodness angels and spirits is separate from the rest of natural philosophy

But to assign the proper office of metaphysics, as contra-distinguished from primary philosophy and natural theology Bacon writes we must note that as physics regard the things which are wholly immersed in matter and movable so metaphysics regards what is more abstracted and fixed that physics supposes only existence motion and natural necessity whilst metaphysics supposes also mind and idea As we have divided natural philosophy into the investigation of causes and the production of effects and referred the investigation of causes to theory which we again divide into physical and metaphysical it is necessary that the real difference of these two be drawn from the nature of the causes they inquire into Physics according to Bacon inquires into efficient and material causes metaphysics into formal and final causes and as mechanics is the practical application of physical theory so what Bacon calls magic is the practical doctrine that corresponds to the metaphysical theory of forms

AGREEMENT OR disagreement concerning the subject matter and problems of that which claims to be the highest human science however named does not seem to be uniformly accompanied by agreement or disagreement concerning the status and development of the discipline in question

There seems to be some similarity for example between Plato s dialectic as an inquiry into forms and Bacon s notion of metaphysics as concerned with formal causes—a similarity which Bacon himself observes But where Plato seems to think that dialectic exists to be taught and learned Bacon s judgment is that this part of metaphysics if not the part dealing with final causes has not yet been developed because the right method has not been employed

Again Aristotle s conception of metaphysics as concerned with the primary axioms the universal principles applicable to all existence and the transcendental properties of being seems to bear some resemblance to Bacon s primary philosophy But Bacon writes as if Aristotle s *Metaphysics* had not been written or at least as if it had not succeeded as Aristotle might have supposed it had in establishing the science which Bacon finds for the most part in a defective or undeveloped condition

If we turn to natural theology either as a part of metaphysics (with Aristotle) or as separate from metaphysics (with Bacon) or as identical with metaphysics (with Descartes) we find the same situation Aside from some verbal and some real differences concerning the objects of the inquiry Aristotle Bacon and Descartes think that the existence of beings

apart from the sensible world of matter and change can be demonstrated and that some thing can be known of their nature—whether they are called immaterial substances spirits and intelligences or God angels and souls

With some alterations in language and thought Plato and Plotinus Augustine and Aquinas Spinoza and Locke can be added to this company They are theologians in that sense of theology which implies a rational knowl edge—without religious faith and either by in tuition or demonstration—of beings which re ally exist yet are not sensible or material or mutable or finite Spinoza for example does not use the word metaphysics but he holds that the human mind possesses an adequate knowledge of the eternal and infinite essence of God Although Locke s use of the word meta physics is derogatory and though the pur pose of his *Essay Concerning Human Understand ing* is to prevent human inquiries from extend ing beyond man s capacities he attributes greater certainty to our knowledge of God and the soul than to our knowledge of bodies, and finds no greater difficulty in our speculations about spirits than about particles of matter

Experimenting and discovering in ourselves knowledge and the power of voluntary mo tion as certainly as we experiment or discover in things without us the cohesion and separa tion of solid parts which is the extension and motion of bodies Locke writes we have as much reason to be satisfied with our notion of immaterial spirit as with our notion of body and the existence of the one as well as the other

But whichever of these complex ideas be clearest that of body or immaterial spirit this is evident that the simple ideas that make them up are no other than what we have received from sensation or refl ction and so is it of all our other ideas of substances even of God himself

As we have already seen Hume and Kant deny metaphysics (so far as it is identified with what is trad tionally natural theology) the status of a val d theoretical science For them it is incapable of taking its place beside physics and mathematics Hume in add tion denies validity to metaphysical speculation concern ing causes and substances in the natural order Unlike Hume who simply removes metaphysi cal problems from the realm of questions worth thinking about Kant does not reject the problems but rather offers alternative methods of stating and solving them He hopes thereby to accomplish a reformation rather than an ab olition of metaphysical inquiry

The existence of God freedom and im mortality must be affirmed Kant thinks, in the order of practical not speculative reason They are indispensable conditions of the nec essary object of our will that is to say con ditions of the practical use of pure reason Yet he adds we cannot affirm that we *know* and *understand* I will not say the actuality but even the possibility of them

Furthermore by redefining metaphysics to mean any system of knowledge *a priori* that consists of pure conceptions Kant not only gives his fundamental treatises in morals and ethics a metaphysical character but sees the possibility of a genuine metaphysic emerging from the *Critique of Pure Reason* Once the dogmatism of metaphysic has been removed that is the presumption that it is possible to achieve anything in metaphysic without a pre vious criticism of pure reason it may not be too difficult to leave a bequest to posterity in the shape of a systematical metaphysic carried out according to the critique of pure reason

Kant s transcendental philosophy and es pecially what he calls the architectonic of pure reason is in a sense that metaphysic al ready begun In subject matter if not in its method or conclusions it resembles the tradi tional inquiry concerning the universal prin ciples and transcendental properties of being The objects of natural theology are of course excluded as being beyond the power of reason to know in a speculative manner

Metaphysics as a possible science is for Kant nothing more than the inventory of all that is given us by *pure reason* systematically ar ranged Such a system of pure speculative reason he says in his original preface to the *Critique* I hope to be able to publish under the title of *Metaphysic of Nature* And in the last pages of the *Critique* wherein he criticizes all speculative efforts in the sphere of natural theology Kant reaffirms the speculative and the practical use of pure reason to constitute a Metaphysic of Nature and a Metaphysic of

thics The former he says is what is commonly called Metaphysic in the more limited sense Both together form properly that department of knowledge which may be termed in the truest sense of the word philosophy The path which it pursues is that of science

when it has once been discovered is lost and never misleads

CONTROVERSIES ABOUT metaphysics can be distinguished from metaphysical controversies— that is disputes within the field of metaphysical thought We have confined our attention to the former throughout this chapter But it may not be possible to judge much less to resolve the issues about the scope methods and validity of metaphysics without engaging in or at least facing issues which are themselves metaphysical

The only way to escape this would be to suppose that psychology (as an analysis of the powers of the mind) or epistemology (as a theory of the criteria of valid knowledge) could determine in advance of any examination of metaphysical discussion whether the matters to be discussed fall within the range of questions concerning which the human mind has the power to find and validate answers But if this supposition is untenable in itself or if it is untenable because psychology and epistemology when they are treated as the first philosophy themselves presuppose a metaphysics or conceal their metaphysical presuppositions then no alternative remains but to judge metaphysics directly by its fruits

In that case the issues surveyed in this chapter require an examination of the metaphysical discussions to be found in such chapters as GOD ANGEL IDEA SOUL IMMORTALITY WILL (which are relevant particularly to the problems of natural theology) and (as relevant to other parts or problems of metaphysics) such chapters as BEING CAUSE FORM MATTER ONE AND MANY RELATION SAME AND OTHER

OUTLINE OF TOPICS

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page **12**.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a–119b**, the passage begins in the upper half of page **116** and ends in the lower half of page **119**. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b–164c**, the passage begins in the lower half of the left-hand side of page **163** and ends in the upper half of the right-hand side of page **164**.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 58 MIND

INTRODUCTION

In the tradition of the great books the word mind is used less frequently than reason intellect understanding or soul There are still other words like intelligence consciousness and even spirit or psyche which often carry some part of the connotation of the word mind Certain authors use mind as a synonym for one or another of these words and give it the meaning which other writers express exclusively in terms of reason or understanding Some discuss mind without reference to soul some identify mind with soul or spirit and some conceive mind as only a part of soul or spirit

For the purpose of assembling in a single chapter references to all discussions which fall within the area of meaning common to all these terms it was necessary to adopt some single covering word Our choice of mind is partly the result of its present currency partly the result of the fact that it is somewhat more neutral than the others and therefore less prejudicial to the conflicting theories which are juxtaposed in this chapter

Words like reason or intellect usually imply a sharper distinction between the functions or faculties of sensation and thought than does the word mind Imagination and memory for example are attributed to the understanding in the writings of Locke and Hume whereas in the analytical vocabulary of Aristotle and Aquinas imagination and memory belong to sense not to reason or intellect Similarly words like soul or spirit usually connote a substantial as well as an immaterial mode of being whereas mind can have the meaning of a faculty or a power to be found in living organisms

The adoption of the word mind is purely a matter of convenience It begs no questions and decides no issues The relations between what is here discussed and the matters considered in the chapters on SOUL, SENSE MEMORY AND IMAGINATION remain the same as they would be if reason or intellect were used in place of mind Different formulations of these relationships are not affected by the words used but by different theories of what the mind is however it is named

Before we consider the diverse conceptions of the human mind which are enumerated under the seven main divisions of the first section in the Outline of Topics it may be useful to examine the elements of meaning more or less common to the connotation of all the words which mind here represents Even here we must avoid begging the question whether mind is a peculiarly human possession Other animals may have minds Mind may be as it is on one theory a universal property of matter According to another theory there may be superhuman minds or intelligences or a single absolute mind a transcendent intelligence

What then does the universe contain because there is mind in it which would be lacking if everything else could remain the same with mind removed? The facts we are compelled to mention in answering this question should give us some indication of the elements of meaning common to mind and all its synonyms

FIRST IS THE FACT of thought or thinking If there were no evidence of thought in the world mind would have little or no meaning The recognition of this fact throughout the tradition accounts for the development of diverse theories of mind None of the great writers denies the phenomenon of thought however differently each may describe or explain it none therefore is without some conception of mind

It may be supposed that such words as thought or thinking cannot because of their own ambiguity help us to define the sphere of mind But whatever the relation of thinking to sensing thinking seems to involve more—for almost all observers—than a mere reception of impressions from without This seems to be the opinion of those who make thinking a consequence of sensing as well as of those who regard thought as independent of sense For both thinking goes beyond sensing either as an elaboration of the materials of sense or as an apprehension of objects which are totally beyond the reach of the senses To the extent that this insight is true the elements or aspects of thought discussed in the chapters on IDEA JUDGMENT and REASONING have an obvious relevance to the various theories of mind discussed in this chapter

THE SECOND FACT which seems to be a root common to all conceptions of mind is that of knowledge or knowing This may be questioned on the ground that if there were sensation without any form of thought judgment or reasoning there would be at least a rudimentary form of knowledge—some degree of consciousness or awareness by one thing of another Granting the point of this objection it nevertheless seems to be true that the distinction between truth and falsity and the difference between knowledge error and ignorance or knowledge belief and opinion do not apply to sensations in the total absence of thought The chapter on KNOWLEDGE reports formulations of these distinctions or differences Any understanding of knowledge which involves them seems to imply mind for the same reason that it implies thought

There is a further implication of mind in the fact of self knowledge Sensing may be awareness of an object and to this extent it may be a kind of knowing but it has never been observed that the senses can sense or be aware of themselves Take for example definitions of sense or theories of sensation and the objects of sense Such definitions and theories must be regarded as works of reflective thought they are not products of sensation

Thought seems to be not only reflective but reflexive that is able to consider itself to define the nature of thinking and to develop theories of mind This fact about thought—its reflexivity—also seems to be a common element in all the meanings of mind It is sometimes referred to as the reflexivity of the intellect or as the reflexive power of the understanding or as the ability of the understanding to reflect upon its own acts or as self consciousness Whatever the phrasing a world without self consciousness or self knowledge would be a world in which the traditional conception of mind would probably not have arisen

THE THIRD FACT is the fact of purpose or intention of planning a course of action with foreknowledge of its goal or working in any other way toward a desired and foreseen objective As in the case of sensitivity the phenomena of desire do not without further qualification indicate the realm of mind According to the theory of natural desire for example the natural tendencies of even inanimate and insensitive things are expressions of desire But it is not in that sense of desire that the fact of purpose or intention is here taken as evidence of mind

It is rather on the level of the behavior of living things that purpose seems to require a factor over and above the senses limited as they are to present appearances It cannot be found in the passions which have the same limitation as the senses for unless they are checked they tend toward immediate emotional discharge That factor called for by the direction of conduct to future ends is either an element common to all meanings of mind or is at least an element associated with mind

It is sometimes called the faculty of will—rational desire or the intellectual appetite Sometimes it is treated as the act of willing which along with thinking is one of the two major activities of mind or understanding and sometimes purposiveness is regarded as the very essense of mentality Considerations relevant to this aspect of mind are discussed in the chapter on WILL.

THESE THREE OR FOUR FACTS—thought knowledge or self knowledge and purpose—seem to be common to all theories of mind More than that they seem to be facts which require the

development of the conception They are for the most part not questioned in the tradition of the great books but they are not always seen in the same light They are not always related in the same way to one another and to other relevant considerations From such differences in interpretation and analysis arise the various conflicting conceptions of the human mind

The conflict of theories concerning what the human mind is what *structure* it has what *parts* belong to it or what *whole* it belongs to does not comprise the entire range of controversy on the subject Yet enough is common to all theories of mind to permit certain other questions to be formulated

How does the human mind operate? How does it do whatever is its work and with what intrinsic excellences or defects? What is the relation of mind to matter to bodily organs *to material* conditions? Is mind a common possession of men and animals or is whatever might be called mind in animals distinctly different from the *human mind? Are there minds* or a mind in existence apart from man and the whole world of corporeal life?

Such questions constitute the major topics of this chapter Other topics which appear here such as the moral and political aspects of mind are reserved for discussion in the many other chapters devoted to the great ideas of moral and political thought Still others like the problem of insanity—the loss or derangement of mind—are obviously relevant here even though the more *general consideration of psy*chopathology belongs elsewhere *e g* in the chapter on MEDICINE

The intelligibility of the positions taken in the dispute of the issues which are here our ma*jor concern depends* to some degree on the divergent conceptions of the human mind from which they stem It seems necessary therefore to examine the *seven notions of mind* which appear in the great books This will at least provide the general context for the reader s further explorations even if it is not possible to trace the implications each of these notions may have for the *great controversial* issues

Seven is of course a fiction of analysis There are from one point of view more—perhaps as many as there are among the great authors thinkers who have dwelt at length on the subject From another point of view there may be fewer than seven for when the lines are drawn according to certain basic differences several of these theories appear to be variants of a single doctrine

THAT IN THE SOUL which is called mind Aristotle writes is that whereby the soul *thinks and judges For him as for Plato the* human intellect or reason is a part or power of the soul of man distinct from other parts or faculties such as the senses and the imagination desire and the passions Though the human soul is distinguished from the souls of other living things by virtue of its having this part or power and is therefore called by Aristotle a rational soul these writers do not identify mind and soul As soul is the principle of life and all vital activities so mind is the subordinate principle of *knowledge and the activities of think*ing deliberating deciding

Within the general framework of this theory *many differences exist between Plato and Aris*totle and between them and others who share their views These differences arise not only with respect to the soul of which the intellect is a part but also with respect to the power or activity of the intellect itself For example the distinction which Aristotle initiates between mind as an active and as a passive power is more explicitly *formulated by Aquinas in his* theory of the active intellect and the intellect as potential

The human intellect Aquinas writes *is in* potentiality to things intelligible and is at first *like a clean tablet on which nothing is written* as the Philosopher says This is made clear from the fact that at first we are only in potentiality towards understanding and afterwards we are made to understand actually And so it is evident that with us to understand is *in a way to be passive* But the forms of things or what Aquinas calls their intelligible species are not actually intelligible as they exist in material things He therefore argues that in addition to the power receptive of such species which is called the *possible intellect* by reason of its being in potentiality to such species there must also be another intellectual power which he calls the active or agent intellect

Nothing he says can be reduced from potentiality to act except by something in act or already actual We must therefore assign on the part of the intellect some power to make things actually intelligible by the abstraction of the species from material conditions Such is the necessity for positing an agent intellect

The more explicit formulation which Aquinas gives of the distinction between the active and the possible intellects as distinct powers has further consequences for the analysis of three states of the passive or possible intellect distinguished by Aristotle The intellectual power which is receptive of the intelligible species may either be in complete potentiality to them as it is when it has not yet come to understand certain things Or it may be described as in habitual possession of the intelligible species when it has previously acquired the understanding of certain things but is not now actually engaged in understanding them In the third place the potential intellect may also be actual or in act whenever it is actually exercising its habit of understanding or is for the first time actually understanding something

In this traditional theory of mind many other distinctions are made in the sphere of mental activity but none is thought to require a division of the mind into two distinct powers or even to require the discrimination of several states of the same power Just as Plato regards the intuition or direct apprehension of intelligible objects as an activity of the same intelligence which is able to reason discursively about the ideas it can contemplate so Aristotle and Aquinas assign three different activities to the intellectual power which apprehends intelligible objects not by intuition but only as the result of the abstraction of forms from matter by the active intellect

Once the possible intellect is actualized by the reception of the abstracted species it can act in three ways It can express in concepts the species which have been impressed upon it This—the first act of the *intellect—is conception* Its second and third acts—of judgment and of reasoning—consist in forming propositions out of concepts and in seeing how one proposition follows from others in inference or proof

Unlike abstraction and conception which *Aquinas assigns to the active and the possible* intellect respectively conception judgment and reasoning do not in his opinion require distinct powers Nor do the two kinds of thought or reasoning which Aquinas calls speculative and practical Th speculative and practical intellects he maintains are not distinct powers for they differ only in their ends. The speculative intelle t directs what it apprehends not to operation but to the sole consideration of truth the practical intellect directs what it apprehends to *operation or* action But to the nature of intellect as a power of apprehension it is accidental whether it be directed to operation or not

Not all the *foregoing* distinctions are made or made in the same way by Plato Aristotle and other authors like Plotinus Augustine or Aquinas who stand together in regardin mind as only a part of the human soul Lucretius belongs with them on this point though he differs radically from them on the issue *of mind and* matter Mind *for him* is only *the directing* principle *of the soul* the head so to speak and reigns paramount in the whole body It is only the thinking or deciding part of the soul. But Plato Aristotle and their followers make a distinction in kind between sensations or images and universal ideas or abstract concepts Sense and intellect are for them distinct faculties of knowing and have distinct objects of knowledge For Lucretius on the other hand thinking is merely a reworking of the images received by the senses In this one respect at least Lucretius is more closely associated with the theory of mind to be found in Hobbes, Lo ke and Hume

In the consideration of mind agreement on one point seems everywhere to be accompanied by disagreement on another Locke does not agree with Lucretius or Hobbes about the materiality of mind and though he agrees with Berkeley that mind is a spiritual entity *he does not agree with him any more than he agrees* with Hobbes and Hume about the abstraction of general concepts from particular sense impressions Plato and Aristotle agree that the senses and the intellect or reason are quite distinct but they do not agree about the relation of these faculties especially not on the extent

to which the mind can act independently of sense and imagination Augustine seems to share Plato s doctrine of reminiscence as an account of how the senses recall actively to mind ideas it has always somehow possessed Aquinas adopts Aristotle s doctrine of abstraction as the quite contrary account of the role the senses play in providing the materials on which the mind works to obtain ideas But Augustine and Aquinas come together on another point in which they depart alike from Aristotle and Plato *They distinguish with precision between* the intellect and will as separate faculties of the soul whereas Plato and Aristotle treat thinking and willing (or knowing and loving) as merely diverse aspects of mental life

The same situation *prevails with respect to* the other theories of mind which we must now consider in their own terms Descartes for ex ample *resembles Plato and Augustine on* the point on which we have seen that they together differ from Aristotle and Aquinas namely the *relation of mind or reason to the senses or imag ination* Yet he is also closer to Aristotle and Plato in a respect in which they together differ from Augustine and Aquinas namely in re garding thinking and willing as acts of the mind rather than as belonging to completely sepa rate faculties

These agreements and differences occur in the context of a basic opposition between Des cartes and all the other writers so far men tioned Unlike all of them he *identifies* the human mind with the rational soul of man In the dual nature of man he says there are cer tain activities which we call corporeal *e g* magnitude figure motion and all those that cannot be thought of apart from extension in space and the substance in which they exist is called *body* Further there are other activi ties which we call *think ng* activities *e g* un derstanding willing imagining feel ng etc which a ree in falling under the description of thought percept on or consciousness The sub stance in which they reside we call a *think ng thing* or *the mind* or any other name we care provided only we do not confound it with cor poreal substance since thinking activities have no affinity with corporeal activities and thought which is the common nature in which the former agree is totally *different from* ex tension the common term for describing the latter Descartes denies that brutes possess thought but even though I were to grant he says that thought existed in them it would in nowise follow that the human mind was not to be distinguished from the body but on the contrary that in other animals also there was a mind distinct from their body

The two components of human nature are according to Descartes each of them substances —*a res cog tans or a thinking substance and a res extensa* or an extended substance Descartes uses the phrases rational soul and mind inter changeably Reason or intellect—the capacity to think—is not a power of the soul Nor is thinking an act which the soul sometimes per forms sometimes does not It is the very es sence of the soul itself even as extension is the essence of body Just as bodies cannot exist *without actually having three dimensions* so the mind cannot exist without thinking

Though it is literally translated into English by *I think therefore I am* Descartes *cogito ergo sum* can be rendered by Thinking is therefore the mind is or by the strictly equivalent statement The mind exists therefore there is thinking It is precisely this equation of the m nd s existence with the activity of thought which Locke challenges

We know certainly by experience he writes that we sometimes think and thence draw this infallible consequence that there is some thing in us that has the power to think but whether that substance perpetually thinks or not we can be no farther assured than ex perience informs us I grant that the soul in a waking man is never without thought be cause it is the condition of being awake but whether sleeping without dream ng be not an affection of the whole man mind as well as body may be worth a waking man s considera tion Methinks every drowsy nod shakes their doctrine who teach that the soul is always thinking

What is striking about this disagreement is that Locke and Descartes agree in the r con ception of man as a union of two distinct sub stances—the un on of a material substance or body with a spi itual substance a mind or soul It is not surprising however that B rkeley

should hold the Cartesian view ag inst Locke Considering the flow of time in terms of the *succession of ideas Berkeley affirms it to be* a plain consequence that the soul always thinks To try to abstract the *existence* of a spirit from its cogitation is he adds modestly no easy task He might have said it is impossible for *since he holds that bodies do not exist and that* man consists of mind or spirit alone he need not hesitate to assert that the mind cannot cease to think without ceasing to be Neither he nor Descartes is in James opinion free to *take the appearances for what they seem to be* and to admit that the mind as well as the body may go to sleep

Despite these differences Descartes Locke and Berkeley seem to agree on the range of ac *tivities within the sphere of mind The mind is* a thinking substance for Descartes yet it also senses and imagines suffers passions and exer cises acts of will What Descartes says in terms of acts Locke says in terms of powers Mind *has many distinct powers* among which Locke includes all the cognitive faculties (not only the powers of abstract thought and reasoning but also those of sense and imagination) and such voluntary faculties as choosing and willing Berkeley also includes the whole range of psy chological phenomena—sensation imagination *memory the passions reasoning and* choice

Hume takes a similar view though in his case one basic qualification must be added He does not conceive the mind as a soul or a spirit or any other sort of substance He even has *some difficulty with the notion of its continuity* or identity from moment to moment in the flow of experience Yet he says it cannot be doubted that the mind is endowed with several powers and faculties that these powers are dis tinct from each other There are many ob vious distinctions of this kind such as those *between will and understanding* the imagina tion and the passions which fall within the comprehension of every human creature What the mind is or how it exists we may not be able to say but Hume thinks that if we can go *no farther than this mental geography or de* lineation of the distinct parts and powers of the mind it is at least a satisfaction to go so far

Descartes theory of mind seems to serve as a point of departure in another direction from that taken by Locke Spinoza agrees that the mind is a thinking thing He agrees that man *consists of an individual* body united with an individual mind But he differs from Descartes on the meaning of substance By its very na ture substance is infinite and because it is in finite there can be only one substance which *is God Finite individual things wh ther bod* ies or minds do not exist as substances but as modes of the divine attributes

The human mind is a part of the infinite intellect of God and therefore Spinoza de *clares when we say that the human mind per* ceives this or that thing we say nothing less than that God has this or that idea *He in* cludes love and desire as well as perception and imagination among the affections of the mind *even calling them modes* of thought He adds however that these do not exist apart from the idea of the thing *loved* or *desired*, though the idea may exist although no other mode of thinking exist

Of the remaining three of the seven concep tions of mind here being considered *two bear* certain resemblances to theories already men tioned

Hegel s view of the human mind as a phase or dialectical moment of the Absolute Mind or *Spirit* seems comparable to *Spinoza s concep* tion of the human mind as a part of God s in finite intellect The Hegelian theory of mind developed in such works as the *Phenomenology of Mind* and the *Philosophy of Mind* is re flected in his *Philosophy of History* and in his *Philosophy of Right* The expression of his view of mind appears therefore in the chapters on History and State as well as here

There seems to be similar justification for associating the views of William James with those of Locke and Hume Willing to posit a soul influenced in some mysterious way by the brain states and responding to them by conscious affections of its own James goes on to say that the bare phenomenon however the immediately known thing which on the *mental side is in apposition* with the entire brain process is the state of consciousness and not the soul itself

What the soul is and whether it exists belong to metaphysics So far as psychological obser

vation and analysis are concerned the phenomena of mind are to be found in the stream of thought or consciousness States of mind are states of consciousness James uses the words feeling or thought to cover every type of mental operation every state of mind every form of consciousness including sensations and emotions desires and wishes as well as conception and reasoning

Locke and Hume distinguish powers of the mind according to different types of mental operation James tends rather to analyze the mind in terms of its diverse states according to different types of mental content But he also lays great stress on the dynamic interconnection of the various elements of consciousness in the continuous flow of the stream of thought

Freud too presents an analysis of different types of mental content and accompanies it by a theory of the different layers of mind—or psychic structure He holds for example that we have two kinds of unconscious—that which is latent but capable of becoming conscious and that which is repressed and not capable of becoming conscious in the ordinary way That which is latent and only unconscious in the descriptive and not in the dynamic sense we call *preconscious* the term unconscious we reserve for the dynamically unconscious repressed so that we have three terms conscious (Cs) preconscious (Pcs) and unconscious (Ucs)

Like James Freud is concerned with the dynamic interaction of various mental operations or contents In addition a further point of similarity exists between them James says that the pursuance of future ends and the choice of means for their attainment are the mark and criterion of the presence of mentality No actions but such as are done for an end and show a choice of means can be called indubitable expressions of Mind Freud goes further in the same direction By identifying psychic energy in general with what he calls libido he implies that mind in its most primitive form has entirely the aspect of desire or seeking It expresses itself in two fundamentally different kinds of instincts the sexual instincts in the widest sense of the word and the aggressive instincts whose aim is destruction

FINALLY THERE is the theory in which mind is neither one of the faculties of the soul nor itself a thinking substance nor is it a soul or spirit with a diversity of powers All our knowledge Kant writes begins with sense proceeds thence to understanding and ends with reason beyond which nothing higher can be discovered in the human mind for elaborating the matter of intuition and subjecting it to the highest unity of thought These three faculties have distinct functions for Kant The sensitive faculty is a faculty of intuition The faculty of understanding is a faculty of judgment and scientific knowledge The faculty of reason when properly employed performs a critical and regulative function in the realm of thought but when employed beyond the province of its power leads thought into blind alleys or dialectical frustrations

Mind is not one of these faculties nor is it the being in which these faculties inhere The notion of mind seems to have significance for Kant primarily in a collective sense It represents the unity and order of the triad of cognitive faculties The faculties of feeling and will—which Kant adds to these in his enumeration of the higher faculties —belong to the transcendental ego but they do not fall within that part of the transcendental structure which is mind Kant s distinction between the speculative and the practical use of reason and his distinction between the moral and the aesthetic judgment involve different relationships between mind—or its triad of faculties—and these other faculties

THE FOREGOING SURVEY of conceptions of the human mind gives some indication of the way in which other questions about mind are answered

With regard to the relation of mind and matter for example the theories of Descartes Spinoza Locke and James seem to affirm a duality of substances or of modes of substance or at least of realms—the physical and the mental They are confronted by the problem of the relation which obtains between the two —their independence or interaction

"Mental and physical events writes James are on all hands admitted to present the strongest contrast in the entire field of being

The chasm which yawns between them is less easily bridged over by the mind than any interval we know Why then not call it an absolute chasm he asks and say not only that the two worlds are different but that they are independent?

James thinks that to urge this theory of the complete independence of mind and body is *an unwarrantable impertinence in the present state of psychology* He prefers the common sense theory that each acts on the other somehow But earlier writers who consider body and mind as distinct substances find grave difficulties in the way of conceiving their interaction How our minds move or stop our bodies by thought which we every moment find they do is according to Locke obscure and inconceivable According to Hume there is no principle in all nature more mysterious than the union of soul with body He interprets one consequence of the union to be that a supposed spiritual substance acquires such an influence over a material one that the most refined thought is able to actuate the grossest matter Were we empowered by a secret wish to remove mountains or control planets in their orbit this extensive authority Hume thinks would not be more extraordinary nor more beyond our comprehension

Denying that bodies exist Berkeley nevertheless argues that even if they did they could exert no influence upon mind Though we give the materialists their external bodies he says they by their own confession are never the nearer knowing how our ideas are produced since they own themselves unable to comprehend in what manner body can act upon spirit or how it is possible that it should imprint any idea in the mind Hence it is evident that the production of ideas or sensations in our minds can be no reason why we should suppose matter or corporeal substances since that is acknowledged to remain equally inexplicable with or without this supposition

Those who deny the existence of matter like Berkeley or the existence of anything immaterial like Lucretius or Hobbes are confronted by problems of their own Berkeley must explain the mind s perception of bodies or why the mind thinks of matter Lucretius must explain perception thought and choice as function of material particles in motion.

The reduction of mind to matter raises a question which leads in the opposite direction. Why may it not be supposed that thought and feeling are present in the universe wherever matter is—an atom of mind inseparably conjoined with every atom of matter as in the mind stuff or mind dust theory which William James considers and criticizes? Still another formulation of the relation of mind to matter is found in the theory of Aristotle and Aquinas according to whom the rational soul is the substantial form of an organic body but the intellect—one of its powers—is not united to matter in any way Mind is said to be immaterial in that understanding or thought does not require a bodily organ

The angelic intellect according to Aquinas is a cognitive power which is neither the act of a corporeal organ nor in any way connected with corporeal matter The human mind is not so completely divorced from matter for though man s intellect is not the act of an organ yet it is a power of the soul which is the form of the body Among all bodily forms the human soul alone has the distinction of possessing an operation and a power in which corporeal matter has no share whatever But Aquinas also maintains that the body is necessary for the action of the intellect not as its organ of action but on the part of the object —the phantasm or image produced by the sensitive faculty He conceives this dependence in the following manner For the intellect to understand actually there is need for the act of the imagination and of the other powers that are acts of bodily organs When the act of the imagination is hindred by a lesion of the corporeal organ for instance in a case of frenzy or when the act of the memory is hindered as in the case of lethargy we see that a man is hindered from understanding actually even those things of which he had a previous knowledge

The problem of body and mind is discussed more fully in the chapter on MATTER Other problems involved in the theory of mind similarly occur in other chapters as well as in this one e g the problem of mind in animals and men (in the chapters on ANIMAL and MAN) the problem of the existence of minds superior to that of man (in the chapters on ANGEL and

GOD) the problem of the origin of ideas in the human mind (in the chapters on IDEA and MEMORY AND IMAGINATION) It should be noted however that agreement or disagreement on the nature of the human mind does not always determine agreement or disagreement with respect to these other questions

Sharing the view that the mind is a spiritual substance Locke and Descartes do not agree about innate ideas or principles Locke tends to agree with Aristotle when he says that the mind is a *tabula rasa* void of all characters without any ideas How comes it to be furnished? he asks Whence has it all the *materials* of reason and knowledge? To this I answer in one word from *Experience* In that all our knowledge is founded and from that it ultimately derives itself Our observation employed either about external sensible objects or about the internal operations of our own minds is that which supplies our understandings with all the *materials* of thinking

But Locke does not accept Aristotle s sharp distinction between the faculties of sense and reason nor does he find it necessary to adopt Aristotle s notion of an active intellect to explain how the mind abstracts general ideas from the particulars of sense perception So far as his theory attributes to mind the power of sense Locke has more affinity with Berkeley and Hume than with Aristotle yet on the question of abstract ideas or the distinction between men and brutes he is as much opposed to them as they are to Aristotle

These few observations may be taken as a sample of the many intricately crossing lines of thought which make the complex pattern of the traditional discussion of mind With few exceptions almost any other choice of authors and topics would provide similar examples That fact combined with the fact that almost every major topic in this chapter leads into the discussion of other great ideas tends to make the chapter on MIND a kind of focal point for perspective on the whole world of thought It is not surprising that this should be the case for on any theory mind is somehow the place of ideas or as Aristotle says the form of forms

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to For example in **4** Homer *Iliad* BK II [265 83] **12d** the number **4** is the number of the volume in the set the number **12d** indicates that the passage is in section d of page 12

Page Sections When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in **53** James *Psychology* **116a 119b** the passage begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page For example in **7** Plato *Symposium* **163b 164c** the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

Author s Divisions One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases e g *Iliad* BK II [265 283] **12d**

Bible References The references are to book chapter and verse When the King James and Douay versions differ in title of books or in the numbering of chapters or verse the King James version is cited first and the Douay indicated by a (*D*) follows e g Old Testament *Nehemiah* 7 45—(*D*) *II Esdras* 7 46

Symbols The abbreviation esp calls the reader s attention to one or more especially relevant parts of a whole reference passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited

For additional information concerning the style of the references see the Explanation of Reference Style for general guidance in the use of *The Great Ideas* consult the Preface

1 Diverse conceptions of the human mind

Chapter 59 MONARCHY

INTRODUCTION

OF all the traditionally recognized forms of government monarchy is the easiest to define and to identify As the word indicates it is government by one man It is indifferent whether that man is called king or prince Caesar or Czar Of all such titles king is the most frequent and in consequence monarchy is often called kingship or referred to as the royal form of government

When monarchy is thus defined in terms of the principle of *unity* other forms of govern ment such as aristocracy or oligarchy and de mocracy tend to be characterized as govern ment by the few or the many But the numeri cal criterion by itself is obviously inad quate To those who distinguish between aristocracy and oligarchy it makes a difference whether the few who rule are selected for their pre emi nence in virtue or in wealth A tyranny like a monarchy may be government by one man Hence those who wish to use the word mon arch or king eulogistically cannot be satis fied with a definition that fails to distinguish between king and tyrant

It has been said—by Aristotle for example—that the perversion of or deviation from monarchy is tyranny for both are forms of one man rule But he adds there is the greatest difference between them the tyrant looks to his own advantage the king to that of his sub jects Both Aristotle and Plato also say that as tyranny is the worst form of government so monarchy at the opposite extreme is the best But though in their opinion tyranny is *always* the worst form of government Aristotle at least does not seem to think that monarchy is always—*under all condit ons*—best

Further complications appear when other views are taken into consideration The chap ters on CITIZEN CONSTITUTION and GOVERN MENT discuss the basic opposition between ab solute and limited government in th various terms in which that opposition is traditionally expressed royal as opposed to political, des potic as opposed to constitutional government or government by m n as opposed to govern ment by law That opposition seems to be rele vant to the theory of monarchy certainly to any con eption of monarchy which tends to identify it with absolute rule or which sees som affinity between royal and despot c gov ernment

The word despotic is of course some times used in a purely descriptive rather than a disparaging sense Used descriptively it desig nates the absolute rule exercised by the head of a household over children and slaves neither of whom have any voice in their own government Aristotle sometimes characterizes the royal government of a political community as des potic to signify its resemblance to the abso lute rule of the father or master He expresses the same comparison in reverse when he says that the rule of a father over his children is royal

The derogatory sense of despotic would seem to apply to those cases in which grown or free men are ruled as if they were children or free men as if they were slaves The great issue con cerning monarchy therefore is whether royal government is despotic in this sense Al vays or only under certain conditions? And if despot is it also tyrannical? Is monarchy in principle the foe of human liberties? To all these ques tions there are opposite answers in the great books of political theory Where Heg l says that public freedom in general and an hered tary monarchy guarantee each other others like Rousseau and Mill identify the freedom of citizenship with republican or representative government

This central issue is complicated not only by

Chapter 59 MONARCHY

INTRODUCTION

OF all the traditionally recognized forms of government monarchy is the easiest to define and to identify As the word indicates it is government by one man It is indifferent whether that man is called king or prince Caesar or Czar Of all such titles king is the most frequent and in consequence monarchy is often called kingship or referred to as the royal form of government

When monarchy is thus defined in terms of the principle of *unity* other forms of govern ment such as aristocracy or oligarchy and de mocracy tend to be characterized as govern ment by the few or the many But the numeri cal criterion by itself is obviously inadequate To those who distinguish between aristocracy and oligarchy it makes a difference whether the few who rule are selected, for their pre emi nence in virtue or in wealth A tyranny like a monarchy may be government by one man Hence those who wish to use the word mon arch or king eulogistically cannot be satis fied with a definition that fails to distinguish between king and tyrant

It has been said—by Aristotle for example—that the perversion of or deviation from monarchy is tyranny for both are forms of one man rule But he adds there is the greatest difference between them the tyrant looks to his own advantage the king to that of his sub-jects Both Aristotle and Plato also say that as tyranny is the worst form of government so monarchy at the opposite extreme is the best But though in their opinion tyranny is *always* the worst form of government Aristotle at least does not seem to think that monarchy is always—*under all conditions*—best

Further complications appear when other views are taken into consideration The chap-ters on CITIZEN CONSTITUTION and GOVERN MENT discuss the basic opposition between ab-solute and limited government in the various terms in which that opposition is traditionally expressed royal as opposed to political des potic as opposed to constitutional government or government by men as opposed to govern-ment by law That opposition seems to be rele vant to the theory of monarchy certainly to any conception of monarchy which tends to identify it with absolute rule or which sees some affinity between royal and despotic gov ernment

The word despotic is of course some-times used in a purely descriptive rather than a disparaging sense Used descriptively it desig nates the absolute rule exercised by the head of a household over children and slaves neither of whom have any voice in their own government Aristotle sometimes characterizes the royal government of a political community as des potic to signify its resemblance to the abso-lute rule of the father or master He expresses the same comparison in reverse when he says that the rule of a father over his children is royal

The derogatory sense of despotic would seem to apply to those cases in which grown men are ruled as if they were children or free men as if they were slaves The great issue con cerning monarchy therefore is whether royal government is despotic in this sense Always or only under certain conditions? And if despotic is it also tyrannical? Is monarchy in principle the foe of human liberties? To all these ques-tions there are opposite answers in the great books of political theory Where Hegel says that public freedom in general and an heredi tary monarchy guarantee each other others, like Rousseau and Mill identify the freedom of citizenship with republican or representative government

This central issue is complicated not only by

form of government The development of the state to constitutional monarchy is the achievement of the modern world He thinks Montesquieu was right in recognizing that the ancient world knew only the patriarchal type of monarchy a kind of transference of familial government to larger communities still organized on the domestic pattern But according to Hegel Montesquieu himself in stressing the role of the nobility shows that he understands not the type of monarchy which is organized into an objective constitution and in which the monarch is the absolute apex of an organically developed state but only feudal monarchy the type in which the relationships recognized in its constitutional law are crystallized into the rights of private property and the privileges of individuals and corporations

It may be questioned however whether Hegel s theory of constitutional monarchy avoids the issue raised by republicans who think that monarchy is inseparable from some form of absolutism or that monarchy if entirely devoid of absolutism has no special character as a form of government In spite of his acceptance of the traditional distinction between constitutional government and despotism Hegel seems to regard the sovereignty of the state as absolute in relation to its own subjects at home—no less absolute than is its sovereignty in external affairs *vis à-vis* foreign states The crown is the personification of the absolute sovereignty of the state at home The absolute power of the state comes into existence only in the person of a monarch who has the final decision in all matters

The sovereignty of the people writes Hegel is one of the confused notions based on the wild idea of the people Taken without its monarchy and the articulation of the whole which is the indispensable and direct concomitant of monarchy the people is a formless mass and no longer a state Hegel thus dismisses the notion of popular sovereignty (which to Rousseau Kant and the Federalists is of the essence of republican government) as inconsistent with the Idea of the state in its full development

A profound opposition therefore exists between Hegel s theory of constitutional monarchy and republican theories of constitutional government Even though the issue cannot be stated in terms of government by men *vs* government by laws a monarchy as opposed to a republic still seems to represent the principle of absolutism in government

THERE IS STILL another conception of a type of government which is neither a pure republic nor an absolute monarchy What the mediaeval writers call a mixed regime is not a constitutional monarchy in the Hegelian sense nor is it what Aristotle means when he uses that term The mediaeval mixed regime is a combination of two distinct principles of government—the *royal principle* according to which absolute power is vested in the sovereign personality of an individual man and the *political principle* according to which the supremacy of law reflects the sovereignty of the people who have the power of making laws either directly or through their representatives

This conception of a mixed regime—of government which is *both royal and political*—appears at first to be self contradictory In Aristotle s terms it would seem impossible to combine the supremacy of law which is the essence of constitutional government with the supremacy of a sovereign person which is the essence of royal government The mixed regime would also seem to be impossible in terms of Hobbes theory of the indivisibility of sovereignty Impossible in theory the mixed regime nevertheless existed as a matter of historic fact in the typical mediaeval kingdom which derived its character from the feudal conditions under which it developed

Does not the fact of its historic existence refute the incompatibility of the principles which the mixed regime combines? The answer may be that like a mixture of oil and water royal and political government can only exist as a mixture in unstable equilibrium Originating under feudal conditions the mixed regime tends toward dissolution as these conditions disappear with the rise of the modern nation state It first tends to be supplanted by a movement toward absolute monarchy Then in the course of reaction and revolution it tends toward constitutional monarchies or republics through added limitations on the power of the throne

These historic developments seem to indicate that the principles of the mixed regime are ulti

ıg to law Of these most clearly exemplified ı the Spartan constitution Aristotle says that the so called limited monarchy or kingship ccording to law is not a distinct form of ;overnment for under all governments as for :xample in a democracy or aristocracy there nay be a general holding office for life and one person is often made supreme over the admin istration of a state

Whether or not there is a supreme command er or a chief magistrate elected or hereditary the government is not distinctively royal if the man called king is subject to the laws and if the other men in the state are not his subjects but his fellow citizens For somewhat different reasons Hobbes agrees with the view that only absolute *monarchy is monarchy When the king is limited in power he says the sovereignty is always in that assembly which had the right* to limit him and by consequence the govern ment is not monarchy but either democracy or aristocracy as of old time in Sparta where the kings had a privilege to lead their armies but the sovereignty was in the *Ephori* Hobbes uses the government of one people over another people—the mother country over colonies or the conqueror over a subjugated nation—to illustrate what he means by absolute monarchy This suggests a significant parallelism between the problems of monarchy and the problems of empire

If there were universal agreement on the point that only absolute monarchy is truly monarchy the issue concerning monarchy could be readily translated into the basic opposition between rule by men and rule by law But such agreement seems to be wanting and the problems of monarchy are in consequence further complicated

Plato for example distinguishes in the *Statesman* between three forms of government according to established laws of which one is monarchy Monarchy is better than aristocracy and democracy obviously not with respect to the principle of the supremacy of law but simply because government by one seems to be more efficient than government by a few or many just as tyranny is the worst form of government because in violating or overthrowing the laws one man can succeed in going further than a multitude which is unable to do either any great good or any great evil

But all these forms of government good and bad better and worse are compared by Plato with a form of government which he says excels them all and is among States what God is among men It seems to be monarchical in type but though not lawless like tyranny it is entirely above the need of written or customary rules of law The best thing of all Plato writes is not that the law should rule but that a man should rule supposing him to have wisdom and royal power Whether such government can ever exist apart from divine rule or perhaps the advent of the philosopher king the point remains that Plato seems to conceive monarchy in two quite distinct ways—both as an absolute rule and also as one of the legally limited forms of government

Montesquieu separates monarchy from absolute government entirely At the same time he distinguishes it from republics whether aristocracies or democracies According to him monarchy is as much a government by law as much opposed to despotism or absolute government as are republics Monarchies and republics are the two main kinds of constitutional government just as aristocracies and democracies are the two main kinds of republic

Where Aristotle holds that constitutional monarchy is not a distinct type of government Montesquieu holds that absolute monarchy does not deserve the name of monarchy but should be called despotism instead He criticizes Aristotle s fivefold classification of kingships saying that among the number of monarchies he [Aristotle] ranks the Persian empire and the kingdom of Sparta But is it not evident he asks that the one was a despotic state and the other a republic? Since Montesquieu s own view of monarchy involves, in addition to a king a body of nobles in whom intermediate and subordinate powers are vested he thinks no true notion of monarchy can be found in the ancient world

Hegel agrees with Montesquieu that constitutional monarchy is the very opposite of despotism but he goes much further than Montesquieu in the direction of identifying monarchy with constitutional government For him constitutional monarchy is the ultimately true

form of government The development of the state to constitutional monarchy is the achievement of the modern world He thinks Montesquieu was right in recognizing that the ancient world knew only the patriarchal type of monarchy a kind of transference of familial government to larger communities still organized on the domestic pattern But according to Hegel Montesquieu himself in stressing the role of the nobility shows that he understands not the type of monarchy which is organized into an objective constitution and in which the monarch is the absolute apex of an organically developed state but only feudal monarchy the type in which the relationships recognized in its constitutional law are crystallized into the rights of private property and the privileges of individuals and corporations

It may be questioned however whether Hegel s theory of constitutional monarchy avoids the issue raised by republicans who think that monarchy is inseparable from some form of absolutism or that monarchy if entirely devoid of absolutism has no special character as a form of government In spite of his acceptance of the traditional distinction between constitutional government and despotism Hegel seems to regard the sovereignty of the state as absolute in relation to its own subjects at home—no less absolute than is its sovereignty in external affairs *vis à vis* fore gn states The crown is the personification of the absolute sovereignty of the state at home The absolute power of the state comes into existence only in the person of a monarch who has the final decision in all matters

The sovere gnty of the people writes Hegel is one of the confused notions based on the wild idea of the people Taken without its monarchy and the articulation of the whole which is the indispensable and direct concomitant of monarchy the people is a formless mass and no longer a state Hegel thus dismisses the notion of popular sovereignty (which to Rousseau Kant and the Federalists is of the essence of republican government) as inconsistent with the Idea of the state in its full development A profound opposit on therefore exists between Hegel s theory of constitutional monarchy and republican theories of constitutional government Even though the issue cannot be stated in terms of government by men *vs* government by laws a monarchy as opposed to a republic still seems to represent the principle of absolutism in government

THERE IS STILL another conception of a type of government which is neither a pure republic nor an absolute monarchy What the mediaeval writers call a mixed regime is not a constitutional monarchy in the Hegelian sense nor is it what Aristotle means when he uses that term The mediaeval mixed regime is a combination of two distinct principles of government—the *royal principle* according to which absolute power is vested in the sovereign personality of an individual man and the *political principle* according to which the supremacy of law reflects the sovereignty of the people who have the power of making laws either directly or through their representatives

This conception of a mixed regime—of government which is *both royal and political*—appears at first to be self contradictory In Aristotle s terms it would seem impossible to combine the supremacy of law which is the essence of constitutional government with the supremacy of a sovereign person which is the essence of royal government The mixed regime would also seem to be impossible in terms of Hobbes theory of the indivisibility of sovereignty Impossible in theory the mixed regime nevertheless existed as a matter of historic fact in the typical mediaeval kingdom which derived its character from the feudal conditions under which it developed

Does not the fact of its historic existence refute the incompatibility of the principles which the mixed regime combines? The answer may be that like a mixture of oil and water royal and political government can only exist as a mixture in unstable equilibrium Originating under feudal condit ons the mixed regime tends toward dissolution as these cond tions disappear with the rise of the modern nation state It first tends to be supplanted by a movement toward absolute monarchy Then in the course of reaction and revolution it tends toward constitutional monarchies or republics through added limitations on the power of th throne

These historic developments seem to indicate that the principles of the mixed regime are ulti

mutually as irreconcilable in fact as they are in theory.

Montesquieu's remark that the ancients "had not a clear idea of monarchy" can be interpreted to mean that they did not have the conception of a mixed regime. Before the accidents of history brought it into existence, it is unlikely that anyone would have conceived of a government both royal and political. Montesquieu does not adopt the mediaeval description of a mixed regime which, as stated by Aquinas, is "partly kingdom, since there is one at the head of all; partly aristocracy, in so far as a number of persons are set in authority; and partly democracy, i.e., government by the people, in so far as the rulers can be chosen by the people, and the people have the right to choose their rulers." Yet Montesquieu's theory of monarchy seems to be determined by characteristics peculiar to the mediaeval kingdom.

This seems to be the point of Hegel's observation, already quoted, that Montesquieu's theory of monarchy identifies it with the feudal kingdom. The point is confirmed in another way by the fact that Montesquieu's ideal of monarchy is the government of England at the end of the 17th century, which he says "may be justly called a republic, disguised under the form of a monarchy." Locke's conception of the English government in his own day tends to clarify this point.

"The form of a government," says Locke, "depends upon the placing of the supreme power, which is the legislative." When the power of making laws is placed in the hands of one man, then it is a monarchy. But according to Locke, "the legislative and executive power are in distinct hands ... in all moderated monarchies and well-framed governments."

What Locke here calls a "moderated monarchy" (intending to describe the government of England) seems to be the mixed regime the form of government which Fortescue had earlier

called a "politi ... om" and Bracton

er regale et pr ... e legislative pow

in the hands ... e or their repre

ives. If it ... lusively to the

a right ves ... erei n person

t merely as ... r ... tive

the lan ... ice

the govern ... an

absolute monarchy. If on the other hand the king were merely a representative, the government would be a republic.

The sovereign character of the king in a mixed regime seems to stem from his unique relation to the laws of the land. In one way he is above the laws and has certain powers not limited by law; in another way, his whole power is limited by the fact that he does not have the power to make laws in his own right or authority. When a people are free and able to make their own laws, Aquinas writes, "the consent of the whole people expressed by custom counts far more in favor of a particular observance than does the authority of the sovereign, who has not the power to frame laws except as representing the people." But Aquinas also says that the sovereign is "*exempt from the law* as to its coercive power, since, properly speaking, no man is coerced by himself, and law has no coercive power save from the authority of the sovereign."

The coercive power of the law belongs to the sovereign as executive, not legislator. Admitting the king to a share in legislative power, Locke conceives his essential function—that which belongs to him alone—as executive. The absoluteness of this executive power Locke defines in terms of the royal prerogative, that "being nothing but a power in the hands of the prince to provide for the public good in such cases which, depending upon unforeseen and uncertain occurrences, certain and unalterable laws could not safely direct." Prerogative, he then goes on to say, "is the power ... to act according to discretion for the public good without the prescription of law, and sometimes even against it."

Locke thus gives us a picture of the mixed regime in which the king's sovereign power is limited to the exercise of an absolute prerogative in performing the executive functions of government. In the executive sphere the king's power is absolute, yet his sovereignty is not absolute, for in the legislative sphere he either has no voice at all where ancient customs prevail or, in the making of new laws, he can count himself merely as one representative of the people among others.

The extent of the prerogative permitted the king depends upon the extent to which mat

ters are explicitly regulated by law When in the infancy of governments the laws were few in number the government was almost all prerogative as Locke sees it He thinks that they have a very wrong notion of government who say that the people have encroached upon the prerogative when they have got any part of it to be defined by positive laws For in so doing they have not pulled from the prince anything that of right belonged to him but only declared that that power which they indefinitely left in his or his ancestors hands to be exercised for their good was not a thing they intended him when he used it otherwise.

Here we see the seed of conflict between sovereign king and sovereign people in the combination of incompatible principles that constitute a mixed regime As the king jealous of his prerogative tries to maintain or even extend his power royal and political government tends toward absolute monarchy As the people jealous of their sovereignty try to safeguard their legislative power from royal usurpations, the mixed regime tends to dissolve in the other direction This happens as it moves toward republican government through various stages of limited or constitutional monarchy in which the sovereignty of the king becomes more and more attenuated

When the king s prerogative includes the power of calling parliament into session nothing short of revolution may resolve the issue for as Locke observes between an executive power in being with such a prerogative and a legislative that depends upon his will for th ir convening there can be no judge on earth

IN THE DIS USSION of monarchy as in the discussion of democracy or other forms of government the fundamental terms and issues do not have the same meaning in the various epochs of western thought The continuity of discussion in the tradition of the great books must be qualified especially in the field of political theory by reference to the differing historic institutions with which their authors are acquainted and concerned Ancient and modern controversies over the merits of monarchy in relation to other forms of government seem to be comparing institutions of government as different as the ancient and modern forms of the democratic constitution

In the ancient world the choice between purely royal and purely political government underlies the meaning and evaluation of monarchy In the modern world with its heritage from the feudal institutions of the Middle Ages either the mixed regime or constitutional monarchy is thought to offer a third alternative The praise of monarchy may therefore be the corollary of a justification of absolute government or the absolute state as with Hobbes and Hegel it may be accompanied by an attack on absolute or despotic power as with Locke and Montesquieu or in defense of purely republican principles monarchy may be attacked as by Rousseau and the Federalists, without differentiation between its absolute and limited forms

This does not mean that there is no continuity between ancient and modern discussion It seems to exist with respect to both elements in the idea of monarchy—the unification of government through its having one head and the rightness of absolute power On the point of unity Plato s argument that monarchy is the most efficient of the several forms of government which are otherwise equally just seems to be paralleled by modern arguments for a unified executive in the constitution of a republic It is also reflected in the reasoning of Montesquieu and Rousseau concerning the greater competence of monarchies to govern extensive territories On the point of absolute power there is some continuity between ancient and modern discussions of government by men versus government by law But here there seems to be greater similarity between ancient and modern arguments against giving sovereignty to an individual human being than there is between the modern defense of monarchy and ancient speculations concern ng royal government

Taking d fferent shape in Hobbes and Hegel the argument for the *necessity* of absolute government seems to be peculiarly modern It is not simply the point made by the ancients that under certain circumstances it may be right for the man of superior wisdom to govern his inferiors in an absolute manner as a father governs ch ldren or a god men The po nt s r ther that the very nature of government and the

state requires a unified repository of absolute power Hobbes does not ask whether the mon arch in whose hands such power is placed deserves this by reason of personal superiority to his subjects Hegel explicitly repudiates the relevance of any consideration of the mon arch s particular character Neither Hobbes nor Hegel argues for the divine right of kings or their divine appointment though Hegel does insist that the constitution itself which estab lishes the supremacy of the crown is not some thing made by man but divine and constant and exalted above the sphere of things that are made

That kings have absolute power by divine right is another peculiarly modern argument for absolute monarchy Not all the water from the rough rude sea says Shakespeare s Rich ard II can wash the balm off from an anointed king The breath of worldly men cannot depose the deputy elected by the Lord According to the theory of divine right the king is God s vicar not as Aquinas thinks the vicegerent of the people The theory of the divine right of kings does not seem to be a mediaeval doctrine It appears later in such tracts as those by Bar clay and Filmer which Locke undertakes to answer

The controversy involves its adversaries in dispute over the interpretation of Holy Writ The anointing of Christian kings is supposed to draw its significance from the establishment of this practice among the ancient Hebrews But the story of the origin of the Hebrew kingship can be given an opposite interpretation

The people of Israel after the leadership of Moses and Aaron first submitted their affairs to the government of judges and there was no king in Israel but every one did that which seemed right to himself Later they went to Samuel their judge saying Make us a king to judge us like all the nations This displeased Samuel Samuel prayed unto the Lord and the Lord said unto Samuel Hearken to the voice of the people in all that they say unto thee for they have not rejected thee but they have rejected me that I should not reign over them The Lord then describes the tribulations the people will suffer at the hands of an earthly ruler with absolute power a punishment they deserve for wanting to be ruled by a king instead of by God and God s law administered for them by judges

THE GREAT POEMS and histories of ancient Greece and Rome would seem to indicate that the divinity of kings is not a modern notion. The deification of emperors and kings certainly appears to be a common practice. But the assumption of divinity by kings is not supposed to signify divine appointment or election by the gods nor do the rulers of the ancient world justify their absolute power as a god given right

Furthermore in the political theory of Plato and Aristotle the analogy between royal rule and divine government works in the opposite direction According to their view the right to absolute government depends upon a radical inequality between ruler and ruled If a god were to rule men on earth as in the myth retold in Plato s *Statesman* he would govern them absolutely deciding everything by his wisdom and without recourse to written laws or estab lished customs If there were a god like man or if a true philosopher were to become kin he too would deserve to be an absolute monarch It would be unjust says Aristotle to treat the god like man merely as a citizen and so to treat him as no more than the equal of those who are so far inferior to him in virtue and in political capacity It would also seem to be unjust for a man who does not have great superiority over his fellow men to rule them like a king instead of being merely a citizen entitled to hold public office for a time

Aristotle frequently refers to royal government as the divine sort of government but he does not justify its existence except when one man stands to others as a god to men Though some of the historic kingships which Aristotle classifies are absolute monarchies none is royal government of the divine sort That seems to remain for Aristotle as for Plato a purely hy pothetical construction

Actual royal government has a patriarchal rather than a divine origin It is the kind of government which is appropriate to the village community rather than to the city state The kingly form of government prevails in the vil lage because it is an outgrowth of the family That is why says Aristotle the Hellenic states were originally governed by kings the Hellenes

were under royal rule before they came to gether as the barbarians still are

In thinkin that absolute or despotic govern ment befits the servile Asiatics but not the free men of the Greek city states Aristotle takes a position which has a certain counterpart in the views of Montesquieu and Mill These modern opponents of absolute monarchy do not assert that constitutional government is unconditionally better than despotism For certain peoples under certain conditions self government may not be possible or advantageous A rude peo ple Mill writes though in some degree alive to the benefits of civilized society may be un able to practice the forbearance which it de mands their passions may be too violent or their personal pride too exacting to forego pri vate conflict and leave to the laws the aveng ing of their real or supposed wrongs In such a case a civilized government to be really ad vantageous to them, will require to be in a con siderable degree despotic to be one over which they do not themselves exercise control and which imposes a great amount of forcible re straint upon their actions Montesquieu seems further to suppose that different races—largely as a result of the climate in which they live—are by nature inclined to vard freedom or servi tude The Asiatics are for him a people whose spirit perpetually dooms them to live under despotism

In contrast Mill s conditional justification of absolute government demands that despotism serve only a temporary purpose It must seek not merely to keep order but by gradual steps to prepare the people it rules for self govern ment Leading strings are only admissible he says as a means of gradually training the people to walk alone When they have reached that stage of development where they are able to govern themselves the despotic ruler must either abdicate or be overthrown

There is a deeper contrast between Mill on the one hand and Aristotle and Plato on the other one which goes to the very heart of the issue concerning royal and political govern ment Both Aristotle and Plato seem to be say ing that if the superior or god like man existed then royal government would be better than the best republic even for the civilized Greeks In calling royal rule the divine form of government they imply that it is the ideal even if it can never be realized This Mill most emphatically denies

The notion that if a good despot could be ensured despotic monarchy would be the best form of government I look upon he writes as a radical and most pernicious conception of what good government is The point at issue is not whether the good despot—the god like ruler or philosopher king—can be found Sup pose him to exist The point then to be made is that the people ruled by one man of super human mental activity would of necessity have to be entirely passive Their passivity is implied in the very idea of absolute power What sort of human beings Mill asks can be formed under such a regimen? Men must actually engage in self government in order to pa s from political infancy to maturity When ever it is possible representative or constitu tional government is therefore better than ab solute monarchy

Chapter 60 NATURE

INTRODUCTION

NATURE is a term which draws its mean ing from the other terms with which it is associated by implication or contrast Yet it is not one of a fixed pair of terms like neces sity and contingency one and many universal and particular war and peace When things are divided into the natural and the artificial or into the natural and the conventional the op posite of the natural does not represent a loss or violation of nature but rather a transformation of nature through the addition of a new factor The unnatural on the other hand seems to be merely a deviation a falling away from or sometimes a transgression of nature

Most of the terms which stand in opposition to nature represent the activity or being of man or God As appears in the chapter on MEDICINE Galen thinks of nature as an artist Harvey later develops this notion But with these two exceptions the traditional theory of art conceives it not as the work of nature but of man Despite other differences in the great books on the theory of art especially with re gard to art s im tation of nature there seems to be a common understanding that works of art are distinguished from productions of na ture by the fact that man has added something to nature A world which man left exactly as he found it would be a world without art or any trace of the artificial in it

The ancient authors who contrast the natural and the conventional and the modern authors who distinguish man s life in a state of nature from his life in civil society seem to imply that without something done by man there would be nothing conventional or political. Locke appears to be an exception here He thinks that there is a natural as well as a civil or political society Natural society is the society of men living together according to reason without a common superior on earth with authority to judge between them Unlike Hobbes or Kant or Hegel Locke does not think that the state of nature is necessarily a state of war But this difference between Locke and others does not affect the point that the political institutions of civil society are things of man s own devising

There may be among the social inse ts na tural organizations such as the bee hive and the ant mound It may even be as Locke sup poses that in a state of nature men living together according to reason would constitute a society But in neither case does the society we call a state result States differ from one another in many features of their political organization In this sense the state or political community is conventional rather than natural its institutions are humanly contrived

The social contract theory of the origin of the state is not necessarily involved in the recognition that the state is partly conven tional Aristotle for example who regards the state as natural—he speaks of it as a creat on of nature —does not think of the political community as natural in the sense in which a bee hive is natural That men should form political communities is in his view the result of a natural desire a tendency inherent in the nature of man as a political animal But what form the political community will take is at least partly determined by the particular ar rangements men voluntarily institute Man made laws are conventional but so also are other institutions which vary from state to state or change from time to time

THE ISSUES IN political theory raised by any consideration of what is and is not natural about society or the state a e d s ussed in other chapters e g FAMILY nd STATE What is true in this connection is likely to be true of each of the other fundamental oppositions in which

the notion of nature is involved The issues raised by the relation of art to nature are for example considered in the chapter on ART those raised by the distinction between nature and nurture are considered in the chapter on HABIT and so on Here we are concerned not with the theoretical consequences of different conceptions of nature but with the various meanings of the term itself as it is used in different contexts

Common to all meanings is the notion that the natural is that which man s doing or making has not altered or enlarged The distinction between nature and nurture confirms this Man s activities are the source of modifications in his own nature as well as in the nature of other things The human nature man is born with undergoes transformations in the course of life the acquirement of knowledge the formation of habits (which are often called second nature) the modification of instincts The sum of these changes represents what nurture adds to nature

When changes of this sort are looked at collectively they give rise to the notions of culture or civilization—two more terms which present a contrast to nature In Rousseau and others we meet the feeling that man may have lost not gained by exchanging the natural for the civilized life The ideal of a return to nature involves more than a return to the soil or an exodus from the city to the country In its most radical form this ideal calls upon man to divest himself of all the artifices and conceits with which he has thought to improve on nature—by renouncing its advances Rousseau says in order to renounce its vices

But why it may be asked is the whole world which man creates not as natural as the materials which man finds to work with—the resources of physical nature and the native equipment which is man s nature at birth? If man himself is a natural entity and if all human activities are somehow determined by human nature then why are not the works of art and science the development of political institutions the cultivation of human beings by education and experience and all other features of civilization—why are not all these just as natural as the falling stone the flourishing forest or the bee hive? Why in short should there by any contrast between the works of nature and the works of man?

THIS QUESTION points to one of the fundamental issues in the traditional discussion of nature Those who uphold the validity of the contrast defend its significance in terms of something quite special about human nature If man were entirely a creature of instinct—if everything man did were determined by his nature so that no choices were open to him and no deviation from the course of nature possible—then the human world would seem to fade into the rest of nature Only on the supposition that man is by nature rational and free do those human works which are the products of reason or the consequences of free choice seem to stand in sharp contrast to all other natural existences or effects of natural causes

Of these two factors—rationality and freedom—the element of freedom is usually the one most emphasized The line is drawn between that which natural causes determine and that which man determines by his own free choice The laws of nature are often conceived as expressing an inherent rationality in nature itself but they also state the uniformity of nature s operations Such maxims of nature as nature does nothing in vain nature abhors a vacuum or nature does nothing by jumps are usually interpreted as describing nature s invariable way of doing things Aristotle s distinction between things which happen naturally and those which happen by chance turns on the regularity of the events which result from causes in the very nature of things The natural is that which happens either always or for the most part

Hence even if there is rationality of some sort in the structure of nature that supposition does not seem to affect the position of those who connect human reason with human freedom and who in consequence divide the things which happen as a result of man s free choice from everything else which happen in the course of nature This may be exemplified by the Greek understanding of the difference between nature and convention The laws of Persia vary from the laws of Greece the political institutions of the city states vary from those of the Homeric age customs and constı

tutions differ from city to city Unlike such conventions that which is by nature Aris totle writes is unchangeable and has every where the same force as fire burns both here and in Persia The conventional is the vari able the natural the uniform The variability of conventions moreover seems to suggest that they are products of freedom or choice

The difference between the bee hive and the human city is that one is *entirely* a creation of nature a social organization entirely deter mined by the instincts of the bees so that wherever bees form a hive it is formed in the same way whereas the human city involves something more than a natural desire of men since when these political animals associate in different places they set up different forms of government and different kinds of law The same comparison can be made between the spider s web or the beaver s dam and such products of human art as cloth and houses The variability of the works of reason as opposed to the uniformity of instinctive productions of all sorts implies the factor of choice in reason s work

THE CONCEPTION OF nature which tries to separate the natural from what man contributes thus seems to depend upon the conception of man Controversies concerning man s difference from other animals especially the dispute about human freedom (considered in such chapters as MAN and WILL) bear directly on the issue of the naturalness of the things which result from man s doing and making

Spinoza for example in holding that human actions constitute no exception to the reign of necessity throughout nature removes any ground for distinguishing the effects of human operation from other effects Man exercises no freedom of choice nor does man in any other way introduce a new principle into the o der or process of nature Hobbes and Locke concur in the deni l of free will but they separate the inventions of man s mind or his social institu tions from what happens without human con trivance in the realm of thought or action The difference between simple and complex ideas for Locke seems to parallel the ancient distinc tion between nature and art

At the other extreme f om Spinoza Kant separates the order of nature and the order of freedom into worlds as radically asunder as the Cartesian realms of matter and mind The world of nature is the system or order of the objects of sense— the sum total of phe nomena insofar as they are connected with each other throughout For Kant this means two things which are strictly correlative Na ture is the object of the theoretic sciences and it is also the realm of time space and causality Like Spinoza Kant identifies the order of na ture with the order of causal necessity But unlike Spinoza Kant places the moral and po litical life of man in an order unconditioned by time space and causality This realm of free dom is the sphere of the moral or practical sciences The natural or theoretic sciences do not extend to what Kant calls the supersen sible or the noumenal order—the world of things lying outside the range of sense experi ence

There is an alternative to Spinoza s location of all events within the order of nature and to Kant s separation of the realm of nature from the domain of freedom It takes the form of Aristotle s or Aquinas distinction between the natural and the voluntary The voluntary is in one sense natural in another not It is natural in the sense that what happens voluntarily in the realm of animal and human motions pro ceeds from causes as natural as those responsible for the motions of inert bodies A voluntary act according to Aquinas comes from an in trins c principle just as the falling of a stone proceeds from a principle of movement in the stone But among the factors respons ble for voluntary acts is knowledge of the end — knowledge of the object being sought The sphere of the voluntary can therefore be equat ed with the sphere of conscious desi e *i e* with desire aroused by an object known wheth er known by sense or reason The natural in the sense in which it is distinguished from the voluntary is the sphere of motions in line with natural desire *i e* with tendencies founded in the very nature of a body or organism and un accompanied by any awareness of the goal toward which it is thus inclined to move

Ari totle s d stinct on between n tural and violent motion (which Galileo and other phys icists adopt) seems to throw light on a double

use of the term natural h re Galileo treats the motion of a freely falling body as natural in contrast to the motion of a projectile In the former case it is the nature of heavy bodies to gravitate toward the earth whereas in the latter case in addition to the motion of gravitation another motion is imparted to the body when it is shot from a gun—a motion which does not proceed from the body s own nature but is caused by the motions of other bodies In terms of this distinction voluntary motions are natural rather than violent In fact the violent is sometimes thought to be even more opposed to the voluntary than to the natural in the sense that a man acting contrary to his will under external coercion suffers violence When he does what he wishes his conduct is not only voluntary but natural *i e* free from the violence of external forces

It is necessary to consider the additional distinction between the voluntary and the free Animals acting from desires caused by the perception of certain objects act voluntarily but in the theory of Aristotle and Aquinas only men freely choose among alternative objects of desire or between means for accomplishing an end The effects of voluntary action differ from other natural events only because knowledge enters into their determination But that which happens as the result of man s free choice is determined neither by his nature nor by his knowledge Hence whatever comes into existence through man s choice stands apart from all that is naturally determined to exist

One other matter bears on this consideration of the natural in relation to the voluntary and the free Spinoza excludes the operation of final causes as well as free choice from the order of nature Purposes or ends are not principles of nature Aristotle on the other hand thinks that final causes are operative in every part of nature He finds them in the sphere of inert bodies which naturally tend toward certain results He finds them in the sphere of animal and human motions where the final cause or end may be an object of conscious desire

So far as the search for causes is concerned nature presents the same kind of problems to the physicist as to the biologist or psychologist In only one sense are final causes peculiarly present in human conduct that is the sense in which the change effected is not the ultimate end but only a means to some further end desired Here there is an extrinsic final cause as well as a final cause intrinsic to the change itself It may be with regard to this special sense that Bacon says of final causes that they are more allied to man s own nature than to the system of the universe Yet Bacon far from denying their presence in the scheme of things assigns the investigation of final causes to metaphysics (as a branch of natural philosophy) rather than to physics For him the ascertainment of final causes does not discover a purpose in the nature of things Rather it looks to God s plan and providence

We have so far dealt with that consideration of nature which opposes the natural to the works of man The discussion of nature also moves on a theological plane Here on one traditional view the natural is not opposed to, but rather identified with the work of God.

Things which are said to be made by nature Plato writes are the work of divine art Those who conceive the universe as God s creation and think of God alone as uncreated being tend to use the word nature collectively for the whole world of creatures and distributively for each type of thing which has its being from God

The distinction between the supernatural and the natural has many interpretations in Christian theology but none more basic than that which divides all being into the uncreated and the created On this view the order of nature includes more than the world of physical sensible things It includes the spiritual creation—angels and souls—as well Immaterial beings are no more supernatural than bodies. They too are created natures Only God is uncreated being

Those who do not have or who deny a doctrine of creation use the word nature in a *less* and in a *more* comprehensive sense The Greek philosophers for example seem to restrict the natural to the physical *i e* to the realm of material sensible changing things. Change is an element in the connotation of the Greek word *phusis* of which *natura* is the Latin equivalent As Greek scientists conceive the

study of nature it is the business of physics to investigate the principles causes and elements of change

Things which are thought to be untouched by chan e such as the objects of mathematics self subsistent ideas or separate forms or things which are thought to be eternal and im mutable such as immaterial substances or in telligences, do not belong to the realm of phys ics or *natural* science In Aristotle s classification of the sciences such beings are the objects of mathematics and metaphysics or theology Since for him whatever is both sensible and mutable is also material the realm of nature includes no more than the whole material uni verse celestial as well as terrestrial

The *more* comprehensive sense of nature appears in Spinoza s identification of nature with the infinite and eternal substance of God Be sides God says Spinoza no substance can be nor be conceived Whatever is is in God and nothing can either be or be conceived without God All finite things are modes of the divine substance or more precisely of the attributes of God such as extension and thought Nature therefore is the totality of finite things both material and immaterial But na ture *exceeds even this totality for the* infinite substance of God is greater than the sum of its parts

To make this clear Spinoza employs the distinction between *natura naturans* and *natura naturata* By *natura naturans* we are to under stand that which is in itself and is conceived through itself or those attributes of substance which express eternal and infinite essence that is to say God in so far as He is considered as a free cause But by *natura naturata* I understand everything which follows from the necessity of the nature of God or of any one of God s attributes in so far as they are considered as things which are in God and which without God can neither be nor be conceived

Viewed under the aspect of time rather than eternity the order of nature (*i e natura na tur ta*) is as much an order of ideas as it is an order of things The order and connection of ideas is the same as the order and connection of things Spinoza writes Whether we think of nature under the attribute of extension or un der the attribute of thought or under any other attribute whatever we shall discover one and the same order or one and the same con nection of causes

Except perhaps for the Stoics like Marcus Aurelius and Epictetus Spinoza seems to stand alone in this conception of nature as all embrac ing *The Stoics too regard nature as the* system of the universe with man a part of its cosmic structure and with God or divinity inherent in nature as the rational principle governing all things But with or without reference to God and creation thinkers like Descartes and Hume tend to identify nature not with the totality of finite things but with the world of bodies in motion or changing sensible things

For Descartes nature does not include the realm of thought or thinking substances though these like bodies are finite and dependent creatures of God For Hume nature seems to be that which lies outside experience—in a way the reality which underlies appearances Where Spinoza thinks that the system of ideas is as much a part of nature as the system of bodies in motion Hume speaks of a kind of pre established harmony between the course of na ture and the succession of our ideas

Hume s distinction between knowledge of *the relation between our own ideas and knowl* ed e of matters of fact or real existence seems furthermore to imply that nature is the reality known (however inadequately) when we assert certain things to be matters of fact Here we perceive another meaning of nature defined by another basic opposition this time between the real and the ideal or the imaginary It is in this sense that mediaeval writers oppose *entia naturae i e* natural or real beings to *entia rationis* or things which have their being in the mind

THIS DISTINCTION like most of the others in which nature is concerned does not have uni versal acceptance Kant as we have seen far from making nature the reality which exists independently of our experience or knowledge conceives the realm of nature as identical with all possible experience We possess two ex pressions Kant writes *world* and *natu e* which are generally interchanged The first denotes the mathematical total of all phenom ena and the total ty of their synthesis And

the world is termed nature when it is regarded as a dynamical whole—when our attention is not directed to the aggregation in space and time but to the unity in the *existence* of phenomena

On quite different principles of analysis Berkeley also treats as natural things the ideas or sensations which are not produced by or dependent on the wills of men Natural beings do not exist apart from the mind but unlike imaginary ones natural beings are those ideas which are not subject to our will or the human mind s own constructive activities Such ideas are produced in our minds immediately by God

To the question whether Nature hath no share in the production of natural things Berkeley answers If by *Nature* is meant the visible series of effects or sensations imprinted on our minds according to certain fixed and general laws then it is plain that Nature taken in this sense cannot produce anything at all But if by *Nature* is meant some being distinct from God as well as from the laws of nature and things perceived by sense I must confess that word is to me an empty sound without any intelligible meaning annexed to it Nature in this acceptation is a vain chimera introduced by those heathens who had not just notions of the omnipresence and infinite perfection of God

Berkeley s view represents one extreme position on a theological issue of the utmost difficulty According to him God is not only the creator or first cause but the sole cause of everything which happens in the course of nature There are no natural causes Nature has no productive power Everything is the work of God or the work of man—nothing the work of nature

Within the limits of this issue the other extreme consists in denying not the creativity of God but the role of divine causality in the production of natural effects It relegates them entirely to the efficacy of natural causes Lucretius, of course denies both the creation of the world and the intervention of the gods in the processes of nature But others like Descartes seem to say that once God has created the physical world once He has formed matter into bodies and given them their initial impetus their motions henceforward need only the laws of nature which God laid down for them to follow For everything that happens in the course of nature natural causes operating under these laws suffice

There is a third position which distinguishes between the work of God in the creation of nature and the work of nature in the production of effects of all sorts such as the natural motions of bodies or the propagation of animals But though it ascribes efficacy to natural agents or second causes in the production of natural effects it also regards natural causes as instrumental to the hand of God the first or principal cause of everything which happens as well as of everything which is Aquinas seems to hold that God acts alone only in the original creation of things whereas in the preservation of created natures and in their causal interaction God works through secondary or natural causes

Some have understood God to work in every agent Aquinas writes in such a way that no created power has any effect in things, but that God alone is the immediate cause of everything wrought for instance that it is not fire that gives heat but God in the fire and so forth But this is impossible First because the order of cause and effect would be taken away from created things and this would imply a lack of power in the Creator Secondly because the operative powers which are seen to exist in things would be bestowed on things to no purpose if things produced nothing through them We must therefore understand that God works in things in such a manner that things have also their proper operation

In other words according to Aquinas God is the cause of action in every agent Furthermore God not only moves things to operate but He also gives created agents their forms and preserves them in being With regard to the being of things Aquinas holds that God established an order among things so that some depend on others by which they are conserved in being though He remains the principal cause of their conservation

With regard to nature itself this theological doctrine raises two sorts of problems The first concerns the efficacy of natural causes,

which are sufficient for the scientist to appeal to in explaining natural phenomena yet are insufficient by themselves for the production of natural effects The second concerns the distinction between the natural and the super natural now not in terms of the created and the uncreated but in terms of what happens naturally (or even by chance) as opposed to what happens as a result of God s intervention in the course of nature

Miracles, for example are supernatural rath er than natural events They are not pro duced by natural causes nor do they happen by accident They are attributed by the theo lo ian to di ine causality yet not in such a way that violence is done to nature. The term *miracle* Aquinas explains is derived from admiration which arises when an effect is manifest whereas its cause is hidden A miracle is so called as being full of wonder in other words as having a cause absolutely hid den from all This cause is God Therefore those things which God does outside the causes which we know are called miracles

The miraculous is that which is beyond the power of nature to accomplish A thing is said to be above the ability of nature Aquinas writes not only by reason of the substance of the thing done but also because of the man ner and th order in which it is done and the more the power of nature is surpassed the greater the miracl Aquinas distinguishes three grades of miracles

The first he says surpasses nature in the substance of the deed as for example if two bod es occupy the same place or if the sun goes backwards or if a human body is glorifie l Su h things nature is absolutely unable to do and these hold the highest rank among mir acles Secondly a thing surpasses the power of nature not in the deed but in that herein it is done as the raising of the dead and giving sight to the blind and the lik For nature can give lif but not to the dead and it can give sight but not to the blind Such hold the second rank in miracles Thirdly a thing ur passes nature s power in the measure and order in which it is done as when a man is cured of a fever suddenly by God without treatment or the usual process of nature These hold the lowest place in miracles

Though each of these kinds has various de grees according to the different ways in which the power of nature is surpassed no miracle according to Aquinas transgresses the order of nature in the sense of accomplishing the im possible Unlike the impossible which would destroy nature the improbable can be elicited by God s power within the general framework of nature

Hume on the other hand thinks that a miracle is a violation of the laws of nature And since in his view a firm and unalterable exp rience has established these laws the proof against a miracle *from the nature of the fact* is as entire as any argument from experience can be Why is it more than probable he asks that all men must die that lead cannot of itself remain suspended in the air that fire con sumes wood and is extinguished by water un less it be that these events are found agreeable to the laws of nature and there is *required* a violation of these laws or in other words a miracle to prevent them?

Nothing is esteemed a miracle Hume con tinues if it ever happens in the common course of nature Th re must therefore be a uniform experience against *every miraculous* event otherwise the event would not merit that appellation And as a uniform experience amounts to proof there is here a direct and full *proof* from the nature of the fact against the existence of any miracle nor can su h a proof be destroyed or the miracle rendered credible but by an opposite proof which is superior

Hume does not think that miracles can be proved against our uniform experience of the order of nature But he also thinks that they are dangerous friends or disguised enemies to the *Christian religion* who would try to defend its beliefs by the principles of human reason

The *Christian religion not only was at first* attended ith miracles he declares but even at th s day cannot be bel eved by any reason able person without one Mere reason is in sufficient to conv nce us of its veracity and whoever is moved by *Faith* to assent to it s conscious of a continu d miracle h s o n person which gives l im a determ nation to believe what is most contrary to c istom and experi n e

ONE OTHER TRADITIONAL conception of natur implicit in much of the foregoing should be noted The various senses of the term so far explicitly considered are alike in this that they justify the use of the word Nature with a capital N and in the singular This other sense of the term appears when we speak of each thing as having a nature of its own and of the world as containing a vast plurality and radical diversity of natures

In this sense we attribute a nature even to things which are contrasted with Nature and the natural We speak of the nature of God and the nature of freedom the nature of art the nature of reason the nature of ideas the nature of the state the nature of customs and habits *This could of course imply a theory that things which are not completely natural* nevertheless have a natural basis as art the state or habit Another meaning however seems to be involved

The phrase nature of' appears almost as frequently in the great books as the word is and frequently it is unaccompanied by any explicit theory of Nature or the natural The discussion of the *nature of* anything seems for the most part to be a discussion of *what* it is To state the nature of anything is to give its definition or if for any reason definition in a strict sense cannot be given then the attempt to state the nature of the thing consists in trying to say what characterizes this thing or kind *of thing in distinction from everything* else or all other kinds

Enumerating the senses of the term nature Aristotle gives this as the fifth meaning The *first four comprise senses which distinguish the* natural from the artificial or the immutable and which indicate that the natural or the physical has an immanent principle of movement in itself and involves matter or potency The fifth sense is that in which nature means the *essence* of natural objects and as he goes on to say this implies the presence in them of *form* as well as *matter* By an extension of meaning from this sense of nature every essence in general has come to be called a nature because the nature of a thing is one kind of essence This is the sixth and most general sense according to which the nature or essence of anything is the object of definition

Does each individual thing have a nature peculiarly its own even if it cannot be defined? Or is a nature or essence always something common to a number of individuals accordin to which they can be classified into kinds and the kinds ordered as species and genera? Do John and James for example have individual natures in addition to the *common nature which they share through belonging to the* human species and does their human nature entail certain properties which are generic rather than specific *i e* which seem to be determined by their having the generic nature common to all animals as well as the specific nature common to all men?

Such questions about individual specific and generic natures raise problems of definition and classification which are discussed in the chapter on EVOLUTION They also raise problems about the existence or reality of the kinds which men define and classify Are they merely what Locke calls nominal essences or do our definitions signify real essences *i e* the natures *of things as they really are? Is the real world* one which as William James says plays right into logic s hands ? Does Nature consist of a *hierarchy* of natures or distinct kinds or is it a *continuum* of things all having the same nature and differing from each other only individually or accidentally but not essentially? These problems are discussed elsewhere in such chapters as ANIMAL DEFINITION EVOLUTION LIFE AND DEATH and SAME AND OTHER

OUTLINE OF TOPICS

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265-283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page **12**.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page **116** and ends in the lower half of page **119**. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page **163** and ends in the upper half of the right-hand side of page **164**.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 61 NECESSITY AND CONTINGENCY

INTRODUCTION

THE basic meaning of the words *necessity* and *contingency* is made known to us by the fact that we can substitute for them the familiar words *must* and *may* Is there any being which *must* exist? asks the same question as Does anything exist of *necessity*? Are all things of the sort which *may* or *may not* exist or are they divided into those which *must* exist and those which *may* or *may not* exist? means the same as Is everything *contingent* in being or do some things exist *necessarily* and some *contingently*?

The great issues which involve the opposition between necessity and contingency are concerned with more than questions about being or existence They also deal with cause and effect judgment and reasoning happenings or events the actions and decisions of men human history and social institutions In each case the problem is formulated by such questions as Does everything which happens in nature or history happen necessarily? Is every thing contingent? Or are some events necessary and others contingent? Is the relation between cause and effect a necessary connection or do some causes produce their effects contingently?

Are there some propositions which the mind *must* affirm because their truth is necessary? Or are all propositions such that they *may* or *may not* be true our affirmation or denial of them being contingent upon factors which lie outside the propositions themselves? In reasoning does the conclusion always follow by necessity from the premises if it follows at all? And are all conclusions which follow necessarily from their premises necessarily true or may some be necessary truths and some contingent?

Are men necessitated in all their acts or are certain actions contingent upon the exercise of their will and in this sense free? Does human liberty consist merely in the freedom of a man s action from the external necessity of coercion or constraint or does it consist in a man s being able to choose whatever he chooses freely rather than necessarily? Is every act of the will necessarily determined or are some acts of the will acts of free choice?

Are certain human institutions such as the family and the state necessary? Are men compelled to live socially or can they choose the solitary life? If domestic and political society are necessary are the ways in which they are organized also necessary or are such things as monogamy in the family and monarchy in the state contingent? Are such things as war slavery poverty and crime necessary features of human society or are they the result of circumstances which are contingent and which can therefore be remedied?

These questions indicate the range of subject matters in which issues are raised concerning the necessary and the contingent They also indicate that the other ideas to which necessity and contingency have relevance are too manifold to permit an enumeration of all the other chapters in which some aspect of necessity and contingency is discussed This chapter stands to the others as a kind of summary of the theme of necessity and contingency It assembles in one place the various topics problems or subject matters which traditionally engage the human mind with that theme

Two chapters alone demand specific mention as in a sense being concerned with ideas that seem to be inseparable from the notions of necessity and contingency They are FATE and CHANCE Though they stand opposed to one another as the necessary to the contingent they do not cover every application of this opposition They are largely concerned with necessity and contingency in the realm of change in the causation of the events of na

ture or the happenings of history They do not deal at least not directly with necessity and contingency in being or existence in thought or knowledge in human acts and social institutions

THE NECESSARY AND the contingent do not seem to be opposed in exactly the sam way in each of the four areas—namely being change thought and action—in which they raise basic issues

In the sphere of human action for example writers like Hobbes Locke and Hume substitute the notion of liberty for contingency as the opposite of necessity The meaning of necessity alters in consequence Liberty according to these authors implies the absence not of all necessity but only of external necessity in the form of compulsion An internal necessity they think is quite compatible with complete freedom

Hume therefore dismisses the supposed conflict between liberty and necessity as groundless By liberty he writes we can only mean *a power of acting or not acting according to the determinations of the will* that is if we choose to remain at rest we may if we choose to move we also may Now this hypothetical liberty is universally allowed to belong to every one who is not a prisoner and in chains Liberty when opposed to necessity not to constraint is the same thing with chance which is universally allowed to have no existence

Similarly Locke defines liberty as a man s power to do or forbear doing any particular action according as its doing or forbearance has the actual preference in the mind which is the same thing as to say according as he himself wills it Liberty in this sense he adds belongs not to the will the acts of which are necessitated by their causes but to the man who is under no external necessity in the form of compulsion to do what is contrary to his will or to refrain from doing what he wills

Hobbes seems to go even further along the same line of thought Holding that liberty is destroyed only by external impediments to action he uses necessity in a sense which makes it consistent with liberty or inseparable from it The actions which men voluntarily do he says because they proceed from their will proceed from *liberty* and yet because every act of man s will and every desire and inclination proceeds from some cause and that from another cause in a continual chain (whose first link is in the hand of God the first of all causes) they proceed from *necessity*

Yet if what Hobbes means by external impediments represents the same nullification of liberty which others call compulsion" or restraint then there is at least one meaning of necessity which stands opposed to liberty Enumerating the meanings of necessary Aristotle lists as one sense the compulsory or compulsion *i e* that which impedes or tends to hinder that which is contrary to impulse or purpose or to the movement which accords with purpose and with reasoning It is in a related sense that Plato opposes necessity to intelligence Necessity represents for him those resistant factors in nature which the mind of man or God must overcome or persuade to give way if reason or purpose is to prevail in the coming to be of anything In this sense necessity like chance is opposed to purpose Blind necessity and blind chance both exclude the operation of final causes both exclude the possibility that the events of nature are directed toward an end

WE SEEM TO HAVE found almost universal agreement on the point that there is one sense in which necessity conflicts with liberty But this agreement does not affect the issue whether liberty is more than freedom from external coercion There are those like Aquinas who think that man s will is free in its acts of choice with regard to particular contingent means. Aquinas agrees that what is called necessity of coercion is altogether repugnant to the will" The same act cannot be absolutely coerced and voluntary But the question is whether the will s acts are necessarily determined by causes operating within the sphere of the will itself

Aquinas names two modes of necessity which operate *within* the sphere of the will and restrict its freedom. One is the natural necessity that the will should desire an ultimate end such as the complete good or happiness If a man wills any object at all as the ultimate goal of his life he cannot will anything other or less than that which can satisfy all his natural desires The

other necessity is that which concerns the use of those means which are absolutely indispensable conditions for reaching the end being sought This may be an absolute or a conditional necessity When the end is itself necessary (*e g* happiness) whatever means are necessary thereto necessitate the will absolutely When a certain end is not necessary but has been freely adopted (*e g* a certain destination) and when *only one* means is available (*e g* one mode of transportation) then it becomes necessary to choose that means But this necessity is conditional since it remains in force only on the condition that we continue to have a certain end in view—an end we can relinquish at any time as freely as we adopted it

According to Aquinas this leaves a great many acts of the will *which are in no way necessitated* those in which there is no necessary connection between the means and a given end and those in which a given means is necessary *only on the condition that a certain end is sought* If the end need not be sought then the will is free not to choose the means of achieving it and if when the end is necessarily sought alternative means are available then the will is free to choose one rather than another

According to this theory liberty consists in the absence of internal as well as external necessity Furthermore liberty seems to be related positively to contingency insofar as freedom of choice depends on a contingent connection between means and ends or upon the contingent *i e* the conditional character of the end On the other hand those who hold that the will is never free from internal necessity insist that the act of choice even with respect to contingent means is always caused If being caused is equivalent to being determined—which seems to be the view of Hobbes Locke and Hume—then whether or not we know what causes a particular choice our wills are so determined that we could not have chosen otherwise

THE PROBLEM OF the freedom of the will in relation to the causes which determine its acts is considered in the chapter on WILL The foregoing discussion suffices here for the purpose of throwing light on the meaning of necessity If now we shift from human action to the realm of becoming change or motion we face the question of the relation between necessity and causation in its most general form

In the realm of nature the alternatives to necessity are referred to as chance and as contingency The significance of these alternatives depends on the theory of causation According to one opinion every effect is necessarily determined by its causes and every cause necessarily produces certain effects Given the causal chain of past events leading up to the present every future event is necessarily determined Nothing that ever happens could happen otherwise Nothing happens contingently or by chance This theory of causation is accordingly a doctrine of universal necessity or absolute determinism in the realm of change

In nature writes Spinoza there is nothing contingent but all things are determined from the necessity of the divine nature to exist *and act in a certain manner* *Though nothing* which exists or happens is contingent God alone exists from the necessity of His own nature and acts alone from the necessity of His own nature The divine necessity is therefore different from the necessity of everything else which follows from the divine nature One is the necessity of freedom or self-determination the other the necessity of compulsion or determination by another That thing is called free says Spinoza which exists from the necessity of its own nature alone and is determined to action by itself alone That thing on the other hand is called necessary or rather compelled which by another is determined to existence and action in a fixed and prescribed manner

Hume s statement that there is no such thing as *Chance* in the world would appear to agree with Spinoza s denial of contingency But Hume also seems to deny the perception of any necessary connection between cause and effect This is not to say that events happen without cause but only that our ignorance of the real cause of any event has the same influence on the understanding as if nothing were necessarily determined by its causes

We are never able Hume thinks to discover any power or necessary connexion any quality which binds the effect to the cause

and renders the one an infallible consequence of the other One event follows another but we never can observe any tie between them They seem *conjoined* but never *connected*

Our idea therefore of necessity and causation arises entirely from the uniformity observable in the operations of nature where similar objects are constantly conjoined together and the mind is determined by custom to infer the one from the appearance of the other These two circumstances form the whole of that necessity which we ascribe to matter Beyond the constant *conjunction* of similar objects and the consequent *inference* from one to the other we have no notion of any necessity or connexion

But the question remains whether in the order of nature itself particular events are necessarily determined or happen contingently The fact that we may be ignorant of real necessities does not as Hume seems to admit imply their non existence Our saying it is only probable that the sun will rise tomorrow may reflect our inadequate knowledge of causes rather than a real indeterminacy in the order of nature On the other hand to say as Hume does that chance has no place in nature may mean only that nothing exists without a cause of its existence rather than that whatever happens is necessarily determined by its causes

As INDICATED IN the chapter on CHANCE two things must be distinguished here the absolutely uncaused—the spontaneous or fortuitous—and the contingently caused or that which depends upon the coincidence of a number of independent causes A given condition may be necessary to produce a certain result as for example oxygen may be necessary for combustion But by itself it may not be sufficient for the production of that effect If the maxim nothing exists without a cause of its existence requires a cause or causes adequate to produce the effect then the maxim is equivalent to the principle of sufficient reason When ever two or more causes each of which may be necessary are not sufficient in separation the existence of the effect depends upon their combination and the effect is contingent if the required combination of causes is itself not necessarily caused

The issue concerning contingency in nature thus seems to be more sharply stated when there is no reference to our knowledge or ignorance of causes On this issue Aristotle and Spinoza appear to be more clearly opposed to one another than Hume is to either

If things do not take place of necessity an event according to Aristotle might just as easily not happen as happen for the meaning of the word fortuitous with regard to present or future events is that reality is so constituted that it may issue in either of two opposite directions For example a sea fight must either take place tomorrow or not but it is not necessary that it should take place tomorrow neither is it necessary that it should not take place yet it is necessary that it either should or should not take place tomorrow Though Aristotle holds that one of the two propositions in such instances must be true and the other false he also insists that we cannot say determinately that this or that is false but must leave the alternative undecided

Aristotle s view with regard to propositions about future particular events is that our judgments cannot be either true or false not because of insufficient knowledge on our part but because future particulars are in themselves always contingent Nothing in the nature of things or causes—existent in the past or present—necessarily determines them to happen They will occur only if independent causes happen to coincide Since these causes are independent—not determined to combination by their natures—the coincidence will be a matter of chance not of necessity

This theory of contingency in the realm of change—involving an affirmation of the real existence of contingent events—raises problems for the theologian concerning God s knowledge and will Does the fact that nothing happens contrary to God s will imply that whatever happens happens necessarily? Aquinas answers that God wills some things to be done necessarily some contingently Therefore to some effects He has attached necessary causes that cannot fail but to others defectible and contingent causes from which arise contingent effects it being His will that they should happen contingently

Similarly the fact that God knows all things

infallibly does not seem to Aquinas to be in consistent with the real contingency of some things He explains that whoever knows a contingent effect in its causes only has merely a conjectural knowledge of it But God knows all contingent things not only as they are in their causes but also as each one of them is actually in itself Hence it is manifest that contingent things are infallibly known by God inasmuch as they are subject to the divine sight in their presentiality yet they are future contingent things in relation to their own causes

This has a bearing on the difference between human and divine apprehension of future contingent things Things reduced to actuality in time Aquinas declares are known by us successively in time but by God they are known in eternity which is above time Whence to us they cannot be certain since we know future contingent things only as contingent futures but they are certain to God alone Whose understanding is in eternity above time Just as he who goes along the road does not see those who come after him whereas he who sees the whole road from a height sees at once all those travelling on it Hence Aquinas continues what is known by us must be necessary even as it is in itself for what is in itself a future contingent cannot be known by us But what is known by God must be necessary according to the mode in which it is subject to the divine knowledge but not absolutely as considered in its proper causes It does not follow therefore that *everything known by God must necessarily be* for that statement according to Aquinas may refer to the thing or to the saying If it refers to the thing it is divided and false for the sense is *Everything which God knows is necessary* If understood of the saying it is composite and true for the sense is *This proposition that which is known by God is is necessary*

With regard to human knowledge Aquinas makes another distinction in answering the question whether man can have scientific or certain knowledge of contingent things If as Aristotle seems to hold the objects of knowledge are necessary not contingent things then the realm of contingency belongs to opinion conjecture or probability Insofar as the particular events of nature are contingent they cannot be objects of scientific knowledge But according to Aquinas contingent things can be considered in two ways either as contingent or as containing some element of necessity since every contingent thing has in it something necessary for example that Socrates runs is in itself contingent but the relation of running to motion is necessary for it is necessary that Socrates moves if he runs

The contingency that Socrates *may* or *may not* run does not alter the hypothetical necessity that *if* he runs he *must* move In its concern with contingent things natural science is concerned only with such hypothetical necessities Unlike physics other sciences may deal with absolutely necessary things That the objects of mathematics are of this sort seems to be an opinion shared by James and Kant Hume and Descartes Plato and Aristotle But they do not agree on whether the necessities of mathematics belong to reality or have only ideal existence *i e* whether they exist apart from or only in the human mind This issue is connected with another major issue concerning necessity and contingency namely whether any reality has necessary existence

As WE HAVE SEEN those who discuss necessity and contingency in the domain of human acts and natural events seem to construe these alternatives differently according as they conceive liberty and chance in terms of different theories of causation With regard to being or real existence however there seems to be a common understanding of the alternatives even among those who do not agree that God alone is a necessary being because they think that this world is also determined to exist as a necessary consequence of God s existence

In the preceding discussions one meaning of contingency has repeatedly appeared The contingent is that which can be otherwise That which cannot be otherwise is necessarily as it is writes Aristotle and from this sense of necessary all its other meanings are somehow derived This insight is sometimes expressed by the statement that the opposite of the necessary is the impossible whereas the contingent—which is neither necessary nor impossible—includes contrary possibilities

In logical analysis what is called the modal

ity of necessity is attributed to judgments the contradictories of which are self contradictory e g if the proposition the whole is *not* greater than any of its parts represents an impossible judgment then the contradictory proposition the whole *is* greater than any of its parts represents a necessary judgment In contrast as Hume points out *that the sun will not rise to morrow* is no less intelligible a proposition and implies no more contradiction than the affirmation *that it will rise* These two propositions represent contrary possibilities No matter which turns out to be true the event could have been otherwise

In logical analysis some complication seems to arise from the fact that the necessary has two opposites *the impossible on the one hand* and the possible or contingent on the other This is usually clarified by the recognition that the possible is the opposite of the impossible as well as of the necessary In that sense of possible which excludes only the impossible the necessary is of course possible for what is necessary cannot be impossible But in that sense of possible which implies contrary possibilities the possible excludes the necessary as well as the impossible

From the proposition it may be it follows according to Aristotle that it is not impossible and from that it follows that it is not necessary it comes about therefore that the thing which must necessarily be need not be which is absurd But again the proposition it is necessary that it should be does not follow from the proposition it may be nor does the proposition it is necessary that it should not be For the proposition it may be implies a two-fold possibility while if either of the two former propositions is true the twofold possibility vanishes For if a thing may be it may also not be but if it is necessary that it should be or that it should not be one of the two alternatives will be excluded It remains therefore that the proposition it is not necessary that it should not be follows from the proposition it may be For this is true also of that which must necessarily be

Of the same thing we can say that it *may* be and that it *may not* be but we cannot say of the same thing both that it *may* be and that it *must* be or that it *may not* be and that it *cannot* be As Aristotle traces the implications of these modes of to be we see that *may be* implies *may-not be* which contradicts *must be* and similarly that *may-not be* implies *may-be* which contradicts *cannot be*

When we pass from the analysis of propositions or judgments to the consideration of being or existence the situation is simpler Since the impossible is that which cannot exist whatever does exist must either be necessary or possible Here the necessary and the possible are generally understood to exclude one another The necessary is that which *cannot* not be the possible that which *can* not be

In spite of this common understanding of the *alternatives there are basic differences* among the authors of the great books in regard to the analysis or demonstration of necessary being

Aristotle for example tends to identify the possible with the perishable—with that which both comes into being and passes away Those substances are necessary in contrast which are not subject to generation and corruption Holding that the matter of the celestial bodies differs from that of terrestrial bodies with respect to the potentiality for substantial change Aristotle seems to regard the heavenly bodies as necessary beings eternal in the sense of always existing even though changeable in regard to place *i e* subject to local motion The changing things of this earth are all contingent in being for the mutability to which their matter inclines them includes coming to be and passing away

This analysis of necessity and contingency in terms of matter s potentialities leads to another *conception of necessary being*—that of a totally immutable being which has necessary existence because it lacks matter entirely and since it consists of form alone is purely actual Whether *or not there are for* Aristotle substances other than the prime mover which are necessary because they are immaterial beings he attributes pure actuality only to that one necessary being *which is an unmoved* mover

Aquinas seems to adopt both of Aristotle s senses of necessary being He treats the celestial bodies and the angels as having necessity to the extent that they are immutable But their immutability is limited in his opinion to the

fact that they are by nature imperishable—the celestial bodies because of their matter the angels becaus they are simple substances not composed of matter and form Since they are creatures they cannot be altogether immutable All creatures Aquinas writes before they existed were possible —and in this sense con tingent as regards their being not necessary As it was in the Creator s power to produce them before they existed in themselves he continues so likewise is it in the Creator s power when they exist in themselves to bring them to nothing Furthermore at every moment of their existence their contingent being depends upon God s power God preserves them in being Aquinas says by ever giving them existence for if He took away His action from them all things would be reduced to nothing

In the strict sense then of necessary being no creature but only God the uncreated be ing is truly a necessary being—because in God alone existence is identical with essence Only a being whose very essence it is to exist is inca pable of not existing only such a being is nec essary in the sense of being purely actual All creat d things must be contingent for if in their case to exist belonged to their very na tures God could not have created them by causing their natures to exist nor when they did exist would His power be necessary to sus tain them in being

Where Aquinas defines God s necessity in terms of the *identity* of essence and existence Descartes and Spinoza tend to conceive God as necessary because his essence is such that his existence *follows from* it The difference may affect the meaning with which it is said that God is uncaused or that God is self caused If its existence is caused Aquinas writes noth ing can be the sufficient cause of its own exist ence According to Descartes to say that God is cause of His own existence merely means that the inexhaustible power of God is the cause or reason why he needs no cause

Descartes position seems to be that that which is self caused in the sense of having its existence d termined by its own nature or es sence is also uncaused in the sense that its exist ence is not caused by anything outside itself Existence he writes is involved in the essence of an infinite being no less than the equality of its angles to two right angles is in volved in that of a triangle But though this suggests the notion of God s existence follo v ing from His essence Descartes also says that in God existence is not distinguished from essence

For Descartes as for Aquinas the basic point remains that that which does not depend for its being upon any external cause exists neces sarily Descartes furthermore associates the necessary existence of an independent being with that being s infinity or perfection of na ture That which is conceived as infinite or per fect cannot be conceived as lacking existence The notion of po sible or contingent exist ence he says belongs only to the concept of a limited thing

Like Descartes Spinoza conceives God as the only infinite and immutable being which exists necessarily in the sense of being that whose essence involves existence But unlike him Spinoza also attributes necessity in an other sense to every finite and mutable thing which God causes to exist for in his view God not only exists necessarily but acting from the necessity of His own nature God also necessi tates whatever follows as a consequence of His action No other world than this is poss ble Things could be produced by God Spinoza writes in no other manner and in no other order than that in which they have been pro duced Furthermore since whatever is in God s power necessarily follows from it and consequently exists necessarily it is impossible for this world not to have existed The existence of this particular v orld is as inseparable from God s ex stence as God s own existence is in separable from His essence or nature

In the tradition of v estern thought there is perhaps no deeper theological issue than that which opposes the freedom of God s will to the necessity of God s acting according to His nature and which in consequence sets the possibility of other worlds (or even of no world at all) aga nst the necessity that if God exists this particular world inevitably follo s

Taking the other s de on both points, Aqui nas for example argues that since the good ness of God is perfect and can exist w thout other thing inasmuch as no perfection can

accrue to Him from them it follows that His willing things apart from Himself is not absolutely necessary As for the particular features of this world Aquinas says that since God does not act from natural necessity nor from a will that is naturally or from necessity determined to the things which exist it follows that in no way at all is the present course of events produced by God from any necessity so that other things could not happen Wherefore we must simply say that God can do other things than those He has done Other and even better worlds than this are possible for God could make other things or add something to the present creation and then there would be another and a better universe

Nor does the Christian theologian admit that the divine nature is subject to any necessity We do not put the life of God or the foreknowledge of God under necessity writes Augustine if we should say that it is necessary that God should live forever and foreknow all things as neither is His power diminished when we say that He cannot die or fall into error—for this is in such a way impossible to Him that if it were possible for Him He would be of less power But assuredly He is rightly called omnipotent though He can neither die nor fall into error For He is called omnipotent on account of His doing what He wills not on account of His suffering what He wills not for if that should befall him He would by no means be omnipotent Wherefore He cannot do some things for the very reason that He is omnipotent

One other traditional issue is raised by the conception of God as a necessary being or more strictly as the only necessary being in the sense of having a nature which involves existence It is formed by opposite views of the validity of the so-called ontological or *a priori* argument for God s existence

Both Descartes and Spinoza argue like Anselm and others before them that since God cannot be conceived as not existing it is impossible in fact for God not to exist Those who reject such reasoning do not deny that it is unintelligible or self contradictory to think of God as merely possible rather than necessary *i e* as requiring a cause outside Himself in order to exist Kant for example admits that existence must be included in the conception of God as *ens realissimum*—the most real and perfect being But he denies that the real existence of the object so conceived is implied by the logical necessity of the conception itself

This amounts to saying that it is possible for a being we cannot conceive except as existing not to exist Aquinas seems to make the same critical point when he says that even if every one understood by the word God something than which nothing greater can be conceived and therefore a being necessarily existing still it would not follow that he understands that what the word signifies actually exists but only mentally

Stated in its most general form the problem is whether that which is inconceivable by the human mind is impossible in reality or whether that which is logically necessary or necessary in thought is also necessary in fact or existence However that issue is resolved it must be noted that among the so-called *a posteriori* demonstrations of God s existence or arguments from the existence of certain effects to the existence of their cause one mode of reasoning turns upon the distinction between contingent and necessary being

If contingent beings exist (as it is evident they do from the mutability and perishability of physical things) *and if* each contingent being is by definition incapable of causing its own existence *and if* one contingent being cannot cause the existence of another *and if* everything which exists must have a cause for its existence either in itself or in another then from all these premises it would seem to follow that a necessary being exists

Here the conclusion may follow with logical necessity from the premises but whether it is necessarily true depends upon the truth of the premises That in turn seems to depend upon the understanding of what it means for anything to be contingent or necessary in being It may also depend on whether or not the reasoning escapes Kant s criticism of all *a posteriori* arguments for the existence of a necessary being namely that such reasoning always implicitly contains the ontological argument and is thereby invalidated

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to For example in **4** Homer *Iliad* BK II [265 283] **12d** the number **4** is the number of the volume in the set the number **12d** indicates that the passage is in section d of page 12

Page Sections When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in **53** James *Psychology* **116a 119b** the passage begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page For example in **7** Plato *Symposium* **163b 164c** the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

Author's Divisions One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases e g *Iliad* BK II [265 283] **12d**

Bible References The references are to book chapter and verse When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (*D*) follows e g Old Testament *Nehemiah* 45—(*D*) *II Esdras* 7 46

Symbols The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited

Chapter 62 OLIGARCHY

INTRODUCTION

IN the great books of political theory the word oligarchy is usually listed along with monarchy and democracy among the traditional names for the forms of government According to the meaning of their Greek roots oligarchy signifies the rule of the few as monarchy signifies the rule of one and democracy the rule of the people—or the many These verbal meanings are somewhat altered however when we consider the actual conflict between oligarchy and democracy in Greek political life It involved an opposition not simply between the few and the many but between the wealthy and the working classes The contest between these factions for political power dominated more than a century of Greek history around the Periclean age and that fact justifies Aristotle s remark that oligarchy and democracy are the two principal conflicting forms of government

We would not so describe the political struggle of our time We would not speak of oligarchy as one of the principal forms of government in the world today Instead we tend to think in terms of the conflict between democracy and dictatorship or despotism Even when we look to the background of present issues it is the age old struggle between absolute and constitutional government—or between monarchies and republics—which seems to supply the obvious historical parallels for the contemporary conflict between the principles of arbitrary and legal government The traditional terms of political theory with the exception of oligarchy thus appear to have a certain liveliness in the consideration of current problems But though it does not have such frequency in our speech or familiarity in our thought oligarchy may be much more relevant to the real issues of our day than appears on the surface

Certainly within the framework of constitutional government oligarchical and democratic principles are the opposed sources of policy and legislation In modern as in ancient republics the division of men into political parties tends to follow the lines of the division of men into economic factions The ancient meanings of oligarchy and democracy especially for those observers like Thucydides and Aristotle who see the rich and the poor as the major rivals for constitutional power indicate the fusion of political and economic issues

The difference between oligarchy and democracy says Aristotle is not well-defined by reference to the few and the many unless it is understood that the few are also the rich and the many the poor The issue is not whether the few are wiser than the many or whether it is more efficient to have the government in the hands of the few rather than the many Such issues have been debated in the history of political thought but they are more appropriate to the alternatives of aristocracy and democracy than to the conflict between oligarchy and democracy

The historic struggle between oligarchs and democrats—whether described as a struggle between rich and poor nobility and bourgeoisie landed gentry and agrarian peons owners and workers classes and masses—is a struggle over the political privileges of wealth the rights of property the protection of special interests In the tradition of the great books Marx and Engels may be the first to call this struggle the class war but they are only the most recent in a long line of political and economic writers to recognize that the economic antagonism of rich and poor generates the basic political conflict in any state Any city however small says Socrates is in fact divided into two one the city of the poor the other of the rich these are at war with one another

OLIGARCHY IS NOT always defined as the rule of the wealthy nor is it always conceived as the opponent of democracy on constitutional ques tions In the *Statesman* for example Plato first divides the forms of government into mon archy the rule of the few and the rule of the many and then divides the rule of the few in to aristocracy which has an auspicious name and oli archy Here aristocracy and oligarchy seem to be regarded as opposites the one a government in which the few rule according to the laws the other lawless government by the few In both the few are the wealthy hence wealth is no more characteristic of oligarchy than of aristocracy

Some political theorists make no reference to wealth at all in the discussion of oligarchy Hobbes divides the forms of government ac cording to whether the sovereign power is in the hands of one or more and if in the hands of more than one then whether it is held by some or all He calls the several forms of government monarchy (one) aristocracy (some) and de mocracy (all) There are other names of gov ernment in the histories and books of policy he adds such as *tyranny* and *ol garchy* But they are not the names of other forms of govern ment but of the same forms misliked For they that are discontented under *monarchy* call it *tyranny* and they that are displeased with *aris tocracy* call it *ol garchy* Like Hobbes both Locke and Rousseau use no criterion except numbers to distinguish the forms of govern ment Locke calling government by the few oligarchy and Rousseau calling it aristoc racy

Barely outlined in this way the alternatives of monarchy aristocracy *or* oligarchy and de mocracy seem to raise issues only of expediency or efficiency rather than of justice Whether oligarchy *is* intrinsically a good or bad form of government tends to become a question only when other factors are cons dered when for example the distinction betv een aristocracy and oligarchy is made to turn on whether the few are men of virtue or men of property or when in the comparison of oligarchy with de mocracy the emphasis is not upon numbers but on the principles of wealth and liberty

Nevertheless the numerical criterion does not seem to be totally irrelevant to the com parison Oligarchy and democracy Aristotle writes are not sufficiently distinguished mere ly by these two characteristics of wealth and freedom Though the real difference be tween democracy and oligarchy is poverty and wealth and though wherever men rule by reason of their wealth whether they be few or many that is an oligarchy Aristotle does not seem to think we can neglect the political sig nificance of what he calls the accidental fact that the rich everywhere are few and the poor numerous

With regard to aristocracy and oligarchy the chief question does not seem to be one of prin ciple but of fact Plato in the *Republic* and Aristotle in the *Politics* define aristocracy as gov ernment by the few best men or the most virtuous They also place it next to what is for them the ideal government by the supremely wise man—the rule of the philosopher king or what Aristotle calls the divine sort of govern ment In this context oligarchy represents a perversion of aristocracy as tyranny represents a corruption of monarchy

Plato describes oligarchy as arising when riches and rich men are honored in the State and when the law fixes a sum of money as the qualification for citizenship and allows no one whose property falls below the amount fixed to have any share in the government But according to Socrates wealth does not qualify men to rule as virtue and wisdom do Just think what would happen he says if pilots were to be chosen according to their property and a poor man were refused per mission to steer even though he were a better pilot To which Adeimantus agrees that in government as in navigation the probable re sult would be shipwreck.

But though there may be no question of the superiority of aristocracy over oligarchy in principle the critics of aristocracy question whether any h storic state in which the few hold political power is not in fact an oligarchy It may not always be the case that the power of the few rests directly on wealth The privileged class may be a military clique or an hered tary nobility Yet these distinctions are seldom un accompan ed by the control of la d or other forms of wealth so that indirectly t least the oligarchical factor is thought to be operative

The criticism of aristocracies as masked oligarchies is discussed in the chapter on Aristocracy The critical point seems to be that nothing except superior virtue or talent justifies a political inequality between the few and the many The meaning of oligarchy is generalized in consequence to include any government in which the special privileges or powers held by the few cannot be justified whether it is wealth or some other title to pre eminence that is substituted for superiority in virtue or talent When it is so understood the word oligarchical tends to become like tyrannical a term of reproach

In describing different forms of democracy Aristotle observes that their common principle is to give a share in the government to all who meet whatever minimum qualification is set by law The absolute exclusion of any class he says would be a step towards oligarchy To the same effect is Mill s comment on the steps away from oligarchy accomplished by English constitutional reforms in the 19th century

In times not long gone by Mill writes the higher and richer classes were in complete possession of the government A vote given in opposition to those influences was almost sure to be a good vote for it was a vote against the monster evil the over ruling influence of oligarchy But now that the higher classes are no longer masters of the country now that the franchise has been extended to the middle classes a diminished form of oligarchy still remains The electors themselves are becoming the oligarchy —in a population where many are still disfranchised 'The present electors Mill continues, and the bulk of those whom any probable Reform Bill would add to the number are the middle class and have as much a class interest distinct from the working classes as landlords or great manufacturers. Were the suffrage extended to all skilled laborers, even those would or might still have a class interest distinct from the unskilled

Oligarchy remains according to Mill so long as there is any unjustifiable discrimination among classes in the population It is not in his view limited to discrimination based on the extremes of wealth and poverty as he plainly indicates by his remarks on the special interests of different parts of the working class or their relation as a whole to the lower middle classes He makes this even plainer by what he has to say on political discrimination as between the sexes Suppose the suffrage to be extended to all men, he writes suppose that what was formerly called by the misapplied name of universal suffrage and now by the silly title of manhood suffrage became the law the voters would still have a class interest as distinguished from women

The oligarchical defect in representative government which Mill is here criticizing seems to have little or no basis in economic class divisions The exclusion of any class in the population from a voice in government renders that government oligarchical with respect to them The excluded class may even be a minority So conceived oligarchy no longer means the rule of either the rich or the few

When the meaning of oligarchy is generalized in this way the discussion of oligarchy seems to presuppose the typically modern conception of democracy As indicated in the chapter on Democracy the distinguishing feature of the modern democratic constitution is universal suffrage By this criterion the conflict between the democrats and the oligarchs of the ancient world appears to be a conflict between two forms of the oligarchical constitution—one in which the wealthier few and one in which the poorer many have political rights, but in neither of which membership in the political community includes all normal adult human beings in the population

Where ancient political theory could conceive of a mixed constitution—somehow combining oligarchical and democratic principles—the modern conception of democracy seems to make any compromise with oligarchy impossible Certain modern writers notably Mosca, Michels and Pareto seem to insist on the contrary that oligarchy is present in all forms of government and is especially prevalent in representative democracies where the actual conduct of government—the effective power—is in the hands of a bureaucracy or an elite whether popularly chosen or self-appointed But the contradiction may be more verbal than real if on one side the word oligarchy means some degree of restriction in the franchise or citizenship and on the other it applies to any situa

tion in which the whole people are not directly active in all the affairs of government and consequently a small number of men administers the state Understood in the latter sense the oligarchical principle does not seem to be incompatible with representative democracy Those who use the word in this sense merely call attention to an inevitable characteristic of representative government A representative democracy may also have an aristocratic aspect when it follows the principle that the men best qualified by virtue or talent for public office should be chosen by the suffrage of all their fellow citizens

Fuller discussion of thes aspects of oligarchy is found in the chapters on Aristocracy and Democracy Here we are primarily concerned with political issues which have their source in the opposition of economic classes in the state primarily that extreme division of men into those who live by their labor and those who live on their property and the labor of others It is in terms of this extreme division between men of leisure and working men that the conflict between oligarchy and democracy takes place in the ancient world

At a time when citizenship meant a much more active and frequent participation in government than it does under the modern institutions of the ballot box and the representative assembly the ancient defenders of oligarchy could argue that only men of wealth had the leisure requisite for citizenship Oligarchy could be further defended on the ground that in many of the Greek city states public officials were either not compensated at all or at least not substantially Only men of sizeable property could afford to hold public office

Aristotle weighs the arguments for and against oligarchy On the point of leisure for example he holds that nothing is more absolutely necessary than to provide that the highest class not only when in office but when out of office should have leisure Yet even if you must have regard to wealth in order to secure leisure it is surely a bad thing he thinks that the greatest offices such as thos of kings and generals should be bought The law which allows this abuse makes wealth of more account than virtue.

Aristotle seems to regard democratic and oligarchical claims as complementary half truths

Both parties to the argument he says are speaking of a limited and partial justice but imagine themselves to be speaking of absolute justice According to an adequate conception of political justice it is as unjust to treat equals unequally as it is to treat unequals equally The oligarch violates the first of these principles the democrat the second Democracy arises out of the notion that those who are equal in any respect are equal in all respects because men are equally free they claim to be absolutely equal Oligarchy is based on the notion that those who are unequal in one respect are in all respects unequal being unequal that is in property they suppose themselves to be unequal absolutely

Both forms of government have a kind of justice but tried by an absolute standard they are faulty and therefore both parties whenever their share in the government does not accord with their preconceived ideas stir up revolution In oligarchies the masses make revolution under the idea that they are unjustly treated because they are equals and have not an equal share and in democracies the notables revolt because they are not equal and yet have only an equal share

What can cure this situation in which perpetual revolution seems to be inevitable as democracy succeeds oligarchy or oligarchy democracy in the government of the Greek cities? Aristotle describes many forms of oligarchy and democracy but none seems to remove the cause of revolution When in an attempt to preserve their position the wealthier families turn to the more extreme forms of oligarchical constitution that tendency eventually leads to a kind of despotic government which Aristotle calls dynasty or the lawless rule of powerful families

To establish a stable government which shall be less subject to revolution in favor of a contrary principle of government and which shall resist the tendency toward lawless rule by either the masses or the powerful few Aristotle proposes the mixed constitution wh ch shall combine the elements of both democratic and oligarchical justice But this will not work in actual practice he th nks unless the middle class

is large and stronger if possible than both the other classes Great then is the good fortune of a state in which the citizens have a moderate and sufficient property for where some possess much and the others nothing there may arise an extreme democracy or a pure oligarchy or a tyranny may grow out of either extreme These considerations will help us to understand why most governments are either democratical or oligarchical The reason is that the middle class is seldom numerous in them and whichever party whether the rich or the common people transgresses the mean and predominates draws the constitution its own way and thus arises either oligarchy or democracy

From the point of view which sees no justice in granting any special privileges to property Aristotle s position on oligarchy seems open to question For one thing in admitting a partial justice in the principle that those who are unequal in wealth should be treated unequally in the distribution of political power Aristotle appears to affirm that the possessors of wealth *deserve* a special political status For another thing in his own formulation of an ideal polity Aristotle advocates the exclusion of the working classes from citizenship The citizens must not lead the life of mechanics or tradesmen for such a life is ignoble and inimical to virtue Neither must they be husbandmen since leisure is necessary both for the development of virtue and the performance of political duties. All these classes of men are necessary for the existence of the state but they are to be no part of it in the sense of political membership "The best form of state will not admit them to citizenship though it will include as necessary the slaves who minister to the wants of individuals or mechanics and laborers who are the servants of the community

Some of the great speeches in Thucydides *History* which deal with domestic issues as well as the issues of war and peace eloquently argue the opposite side of the case Debating with Hermocrates before the Syracusan assembly Athenagoras answers those who say that democracy is neither wise nor equitable but that the holders of property are the best fitted to rule I say on the contrary first that the word *demos* or people includes the whole state oligarchy only a part next that if the best guardians of property are the rich and the best counsellors the wise none can hear and decide so well as the many and that all these talents severally and collectively have their just place in a democracy But an oligarchy gives the many their share of the danger and not content with the largest part takes and keeps the whole of the profit

In modern political thought the discussion of oligarchy seems to occur on two levels There is a controversy on the level of constitutional principles with regard to suffrage and representation and the qualifications for public office Here the issues concern the justice of the fundamental laws of republican or popular government There is also a consideration of the way in which men of property or corporate concentrations of wealth are able to exert influence upon the actual course of government Here the problem becomes, not so much the justice of the constitution or of the laws, but the weight which wealth seems able to throw onto the scales of justice.

The great modern defense of the oligarchical constitution does not seem to be as plainly or forcefully made in any of the great books as in the speeches of Edmund Burke especially those in opposition to the suffrage reform measures proposed by Charles James Fox, wherein Burke argues for the principle of *virtual* representation. It is unnecessary he claims for the franchise to be extended to the working classes if their economic betters—who also happen to be their superiors in talent and education—deliberate on what is for the common good of all

The Federalists seem to take an opposite view Reflecting on the system of British representation in their day they observe that for the eight millions of people in the kingdoms of England and Scotland the representatives in the House of Commons amount to five hundred and fifty-eight But they go on, of this number one ninth are elected by three hundred and sixty four persons and one half by five thousand seven hundred and twenty three persons It cannot be supposed they argue, that the half thus elected and who do not even reside among the people at large can add any thing either to the security of the people

against the government or to the knowledge of their circumstances and interests in the legislative councils On the contrary it is notorious that they are more frequently the representatives and *instruments of the executive magistrate* than the guardians and advocates of the popular rights Nevertheless they do not condemn such an oligarchical system of representation as entirely inimical to the virtues of parliamentary government It is very certain they declare not only that a valuable portion of freedom has been *preserved under* all these circumstances but that the defects in the British code are chargeable in a very small proportion on the ignorance of the legislature concerning the circumstances of the people

Some of the American constitutionalists may be influenced by Burke s *defense* of oligarchy in terms of the virtues of an aristocracy but they state their own position in terms which are more plainly oligarchical They argue for poll tax clauses and property qualifications for public office on the ground that the country should be run by the people who own it Furthermore those who are not economically independent are not in a position to exercise political liberty Power over a man s subsistence Hamilton declares amounts to power over his will

Facing the issue which had been raised on the floor of the constitutional convention Madison remarks that the most common and durable source of factions has been the various and unequal distribution of property Those who hold and those who are without property have ever formed distinct interests *in society* He proposes a representative—or what he calls a republican —system of government to avoid the excessive factionalism of the pure or direct democracies of Greek city states

Theoretic politicians who have patronized this species of government Madison writes have erroneously supposed that by reducing mankind to perfect equality in their political rights they would at the same time be perfectly equalized and *assimilated in their possessions* their opinions and their passions By a weighted system of representation the power of sheer numbers may be counter balanced by the power given to other factors thus preventing the accomplishment of the secret wishes of an unjust and interested majority

A rage for paper money for an abolition of debts for an equal division of property or for any other improper or wicked project will be less apt to pervade the whole body of the Union *than a particular member of it*

In another paper the Federalists answer the charge that the constitution is oligarchical because the House of Representatives will be taken from that class of citizens which will have least sympathy with the mass of the people *and be most likely to aim at an ambitious sacrifice* of the many to the aggrandizement of the few This objection they say while leveled against a pretended oligarchy in principle strikes at the very root of republican government

The method of election provided for by the Constitution aims to obtain for rulers men who possess most wisdom to discern and most virtue to pursue the common good of the society Who are to be the electors of the federal representatives? Not the rich more than the poor not the learned more than the ignorant not the haughty heirs of distinguished names more than the humble sons of obscurity and unpropitious fortune Who are to be the objects of popular choice? Every citizen whose merit may recommend him to the esteem and confidence of the country No qualification of wealth of birth of religious faith or of civil profession is permitted to fetter the judgment or disappoint the inclination of the people

WHETHER THE AMERICAN Constitution in its original formulation is an oligarchical document has long been a matter of dispute Whether the Federalists favor devices for protecting the rights of property or repudiate oligarchical *restrictions in favor of the rights of man* has also been the subject of controversy That this is so may indicate at least a certain ambiguity in their position But on the question of the oligarchical influences on government—the political pressures exerted by *propertied* classes to serve their special interests—the opinion of the modern authors of the great books seems much clearer

The most extreme statement of this opinion is *of course to be found in the Communist Manifesto* There government in fact the state

self is regarded as an instrument which the economic oppressors wield against the oppressed The final step in the bourgeois revolution according to Marx and Engels occurred when the bourgeoisie conquered for itself in the modern representative State exclusive political sway In the bourgeois state legislation is nothing but the will of this one class made into a law for all One aim of the communist revolution beyond the temporary dictatorship of the proletariat is the withering away of that historic formation of the state in which political power is merely the organized power of one class for oppressing another

Though much less radical in intention than Marx Smith and Mill make statements which seem to be no less radical in their criticism of the oligarchical influences on modern parliamentary government It has been said Smith observes that we rarely hear of combinations of masters though frequently of those of workmen But whoever imagines upon this account that masters rarely combine is as ignorant of the world as of the subject Masters are always and everywhere in a sort of tacit but constant and uniform combination not to raise the wages of labor above their actual rate Masters too sometimes enter into particular combinations to sink the wages of labor even below this rate Furthermore the parties to the conflict do not have equal access to legislative protection Whenever the legislature attempts to regulate the differences between masters and their workmen its counsellors are always the masters

Almost a century later Mill writes in a similar vein concerning the persevering attempts so long made to keep down wages by law Does Parliament he asks ever for an instant look at any question with the eyes of a working man? On the question of strikes for instance it is doubtful if there is so much as one among the leading members of either House who is not firmly convinced that the reason of the matter is unqualifiedly on the side of the masters and that the men s view of it is simply absurd The remedy for this inequity according to Mill is not communism but constitutional reforms in the direction of universal suffrage which will no longer leave the working classes excluded from all direct participation in the government

Chapter 63 ONE AND MANY

INTRODUCTION

IN *Pragmatism* and in his unfinished last work *Some Problems of Philosophy* William James uses the problem of the one and the many as one of the crucial tests of the philosophical mind In his famous table of doctrines or isms he aligns monism with rationalism and idealism in the column headed tender minded and in the other column headed tough minded he places their opposites—pluralism empiricism and materialism But as his own theories show isms like monism and pluralism tend to over simplify the issues

Whoever emphasizes the oneness of the world for example may also acknowledge its many ness and recognize that it is somehow a pluri verse as well as a universe Some like Bradley may qualify this view by regarding the unity as ultimate reality the plurality as appearance or illusion Whoever finds the multiplicity of things the primary fact may nevertheless find some unity in the order and connection of things Some like James himself may insist that the connection is a loose concatenation of relatively independent parts of reality rather than an in terpenetration of each part with every other in the solid whole which James calls the block universe

There may be another oversimplification in James con i l ration of the problem of the one and the many He seems to be concerned largely if not exclusively with the alternatives of the block and the concatenated universe as con ceptions of the structure of reality But as some of the great books of antiquity make evi dent that is only one of the problems of the one and the many Perhaps it should be said not that there are many problems of the one and the many but that there is one problem having many aspects or applications for in every state ment of the problem there is at least this single ness of theme that the one and the many are opposed that the one is *not* a many and the many *not* a one Yet even that does not seem to be quite accurate for as Socrates tells Protar chus in the *Philebus* it may also be said that the one is a many and the many a one These are wonderful propositions he says wonderful because whoever affirms either is very open to attack

At this early moment in the recorded tradi tion of western thought the dialogues of Plato so thorough in their exploration of the problems of the one and many make no claim to having discovered or invented them They were ancient even then They seem to hang in the very atmosphere of thought usually befogging those who try to see the truth about anything else without first clearing away their obscurities.

Socrates refers to the common and acknowl edged paradoxes of the one and the many that everybody has by this time agreed to dis miss as childish and obvious and detrimental to the true course of thought These aside some genuine perplexities remain Protarchus asks Socrates to instruct him about those other marvels connected with this subject which as Socrates seems to have implied have not yet become common and acknowledged

Socrates begins by calling his attention not to the unity of *this* man or *this* ox but to the sense in which it is said that man is one or ox is one or beauty one or the good one It is necessary to ask he says first whether such unities exist then such unities being always the same and admitting neither generation nor destruction how each is itself alone is not only one but *this* one finally how these unities can be conceived as dispersed and multiplied in the world of things which come to be and pass away This last question seems to be the most difficult because it asks about the *being* of the same and one as it *becomes* in the one and many

Protarchus is impatient to begin clearing up these problems Willing to undertake what he calls this great and multifarious battle in which such various points are at issue Socrates is also anxious to let Protarchus and the other youths know the intellectual perils which lie ahead for novices who enter upon this inquiry The one and many he tells them become identified by thought They run about together in and out of every word which is uttered This union of them will never cease and is not now beginning but is an everlasting quality of thought itself which never grows old

That is why he explains any young man when he first tastes these subtleties is delighted and fancies that he has found a treasure of wisdom in the first enthusiasm of his joy he leaves no stone, or rather no thought unturned now rolling up the many into the one and kneading them together now unfolding and dividing them he puzzles himself first and above all and then he proceeds to puzzle his neighbors whether they are older or younger or of his own age—that makes no difference neither father nor mother does he spare no human being who has ears is safe from him hardly even his dog and a barbarian would have no chance of escaping him if an interpreter could only be found

WHETHER IT is full of exasperating subtleties or is a treasure of true wisdom the discussion of the one and the many—in itself and in relation to being and becoming the intelligible and the sensible the definite and the infinite the same and other universals and particulars wholes and parts the simple and the complex the indivisible and the continuous—is a discussion which seems unavoidable to the ancients In the dialogues of Plato and in Aristotle s treatises especially his *Metaphysics* the one and the many are connected with the basic terms of philosophical thought

For Plato the distinction between the one and the many enters into the analysis of almost any object—such as pleasure or virtue or knowledge Anything viewed under the aspect of its being or its becoming its definite sameness or its infinite otherness and variety must be discussed both as a one and as a many The motion of Plato s dialectic may be from the one to the many or from the many to the one or it may be on the level of the many as an intermediate stage through which analysis must go in proceeding from the infinite to the one Those who pass at once from unity to infinity says Socrates do not recognize the difference between the mere art of disputation and true dialectic

For Aristotle first philosophy or metaphysics concerned as it is with being *qua* being and the attributes which belong to anything *qua* being also investigates unity Unity is the first property of being The meanings of one or unity are as various as the meanings of to be If there is a difference between essential and accidental being there is a parallel difference between essential and accidental unity If natural and artificial things differ in substance or being so too must they differ in unity Being and unity are the same Aristotle says and are one thing in the sense that they are implied in one another as are principle and cause Unity is nothing apart from being and nothing can be without being one in some sense of unity which is determined by the way in which the thing exists Aristotle s analysis of any subject matter proceeding as it does by reference to contraries always appeals to the one and the many All contraries he says are reducible to being and non being and to unity and plurality as for instance rest belongs to unity and movement to plurality And everything else is evidently reducible to unity and plurality For all things are either contraries or composed of contraries and unity and plurality are the principles of all contrariety

THE PROBLEMS IN whose analysis one and many seem to be involved recur in every period of western thought The question for example whether there is an irreducible duality in the relation of knower and known or whether in the act of knowledge knower and known are one is discussed by Hobbes and William James as well as Plotinus and Aristotle The question whether the state—which is a multitude somehow united for a common life—has or should have the same degree of unity as the family is discussed by Locke and Hegel as well as Plato and Aristotle

The earlier controversy over the indivisibility of sovereignty becomes at a later stage the central issue of federal union to which *e pluribus unum* is the solution offered by the Federalists Question concerning the simple and the complex or wholes and parts as objects of knowledge or questions concerning the unity and divisibility of time space or matter engage the attention of inquirers and analysts no less in modern than in ancient times

But there are certain problems which are treated with unusual speculative vigor by the ancients alone Unlike the problems just mentioned which deal with applications of the contrast between unity and multiplicity these are questions about the One itself—what it is whether it exists whether it is identical with Being whether it is itself a substance or the substance of all things

The sustained inquiry into such matters in antiquity seems to testify to the extraordinary power exerted upon ancient thought by Parmenides of Elea The person called the Eleatic Stranger represents his theories in such dialogues of Plato as the *Sophist* and the *Statesman* Parmenides or his disciple Zeno is probably the source of many of the paradoxes and riddles which Socrates in the *Philebus* dismisses as no longer worthy of serious attention One whole dialogue named *Parmenides* because of his part in the discussion exhibits the Eleatic demonstration that all is one It abounds in the subtleties of the various arguments which try to defend the reality of the many or try to reduce that position to absurdity

Questioned by Socrates concerning his paradoxes Zeno says that his writings were meant to protect the arguments of Parmenides against those who make fun of him and seek to show the many ridiculous and contradictory results which they suppose to follow from the affirmation of the one When he addresses himself to the partisans of the many Zeno says that he returns their attack with interest by retorting upon them that their hypothesis of the being of many if carried out appears to be still more ridiculous than the hypothesis of the being of one

Aristotle also deals with the Eleatic arguments. In the *Physics* he says first that inquiring about whether being is one cannot contribute to the study of nature He then adds that such inquiry anyway would be like arguing against any other position maintained for the sake of argument or like refuting a merely contentious argument This description he says applies to the arguments both of Melissus and Parmenides their premises are false and their conclusions do not follow Accept one ridiculous proposition and the rest follows—a simple enough proceeding Aristotle's treatment of Parmenides and Zeno in the *Metaphysics* seems to be no more sympathetic though it tacitly admits the relevance of the Eleatic speculation to the study of being if not to the study of change and the principles of nature Nevertheless many of the questions concerning the one and the many which both Plato and Aristotle deem worthy of discussion appear to have some connection with the perplexities propounded by Parmenides and his school

Those who do not deny either the unity of being or its multiplicity tend to make the primary fact about reality either its oneness or its manyness This may seem at first to be of slight significance but if the two views of the world which result from this difference are examined it may be found that the disagreement on this single point changes the perspective on everything else The philosophers who magnify either the one or the many behold universes more radically dissimilar than the same object looked at from opposite ends of a telescope But that is not all Almost every other fundamental conception—of God and man of the mind and knowledge of matter and motion of cause and necessity—seems also to be altered

Spinoza for example criticizes those who attribute to finite things of which there are necessarily many the properties which belong to the infinite being of which there can be only one This man this stone or any comparable individual thing is not a substance having the power to exist in and of itself it consists merely of certain modifications of the attributes of God the one infinite substance in which everything else both is and is conceived According to Spinoza those who suppose that the finite many are substances have not observed a proper order of philosophic study

They begin with the objects of sense which have the least reality and come last to the dr

vine nature the infinite one which ought to be studied first because it is first in the order of knowledge and in the order of things Hence it has come to pass Spinoza continues that there was nothing of which men thought less than the divine nature while they have been studying natural objects and when they afterwards applied themselves to think about God there was nothing of which they could think less than those prior fictions upon which they had built their knowledge of natural things for these fictions could in no way help to the knowledge of the divine nature

Starting with the definition of substance as that which exists in itself and is conceived through itself and with the definition of God as absolutely infinite being that is to say substance consisting of infinite attributes Spinoza undertakes to prove that there cannot be two or more substances having the same nature or attributes that substance is necessarily infinite and hence that it is impossible for more than one substance to exist Since he regards it as axiomatic that everything which is is either in itself or in another it follows for Spinoza that if anything at all exists God (or substance) must necessarily exist—as that which alone exists in itself and as that in which every thing else has its finite being as a mode or affection of the attributes of God

Certain other consequences seem to follow Th one infinite substance is indivisible it is not a whole made up of parts which can have independent existence as the parts of a quantitative whole seem able to exist when the quantity is divided Furthermore God according to Spinoza is the immanent and not the transitive cause of all things God causes them not as one thing acting on another when both are independent in existence but rather as the being *in which* all things are God is not present in the world as other theologians seem to think in the manner in which a cause exists in an effec that depends upon it Rather the whole world is in God as an effect which can in no way be separated from the existence of the cause any more than an aspect can be separated from that of which it is an aspect

For Spinoza the unity and totality of being can be called nature as well as infinite substance or God His distinction between *natura naturans* and *natura naturata* discussed in the chapter on NATURE seems to permit him to distinguish between the infinite or eternal and the finite or temporal—the one and the many—without implying a real separation between God and the world Since God is immanent in the world and since God not only exists necessarily but also acts from the necessity of His own nature it follows (as is indicated in the chapter on NECESSITY AND CONTINGENCY) that every finite and temporal aspect of nature is necessarily determined Nothing is contingent Nothing could be otherwise than it is

THIS EXAMINATION of a doctrine in which the primacy of the one absorbs as well as subordinates the many serves to exemplify the point that making the one primary is more than a matter of emphasis It also shows that almost every fundamental question is affected It presents a picture of what William James appears to mean when he speaks of the block universe though he himself usually seems to have in mind Hegel s Absolute rather than Spinoza s God

Aristotle advances a contrary doctrine Like Spinoza he uses the term substance Like Spinoza he defines substance as that which exists in itself not as an accident (a quality for example) which exists in another *e g* the redness in the rose But for him substance is not necessarily infinite, nor is it indivisible A rose or a man is a substance Every physical thing which has a natural unity is a substance

Each is a finite whole or rather each is a whole in a number of different senses Insofar as it has essential unity it is a whole composed of matter and form which according to Aristotle are represented in the formulation of a definition by the genus and the differentia Insofar as it is composed of matter it also has the unity of a quantitative whole in virtue of which it moves as one thing or uniquely occupies a place Since quantitative unity involves continuity and continuity entails divisibility a substance remains one only so long as it is not divided into its quantitative parts just as it remains one essentially only so long as its matter and form are not separated

A substance is individual not because it is absolutely indivisible—as for Lucretius the atom

is because it is simple rather than composite Its individuality rather consists first in its being divided from other substances in such a way that it can perish without necessarily destroying them or they can perish without destroying it and second in the fact that though divisible into parts it is one whole when these parts remain undivided Yet as one substance it has more unity than a mere collection of things

The difference between a man and a machine according to Aristotle s differentiation between the unity of natural substances and of artificial things is that a man is not composed of substances (though the parts of a living organism may come to exist as substances when it is decomposed or they are separated from it) whereas a machine made up of separate pieces of metal is nothing but a number of individual substances arranged in a certain way The unity of man does not appear to be the same therefore when soul and body are conceived by Descartes as two substances and by Aristotle not as distinct substances but as form and matter which through their union constitute a single substance

Unity in short belongs essentially to the individual natural substance Because each individual substance is necessarily a one among a many Aristotle unlike Spinoza cannot affirm the unity of substance without also affirming a plurality of substances Not itself a substance but only an aggregation of substances the world is primarily a many rather than a one The unity it possesses derives from the order and connection of the substances which are its component parts and that in turn largely derives from the way in which distinct substances causally interact

Since according to Aristotle causality includes contingency and chance the causal interdependence of substances with respect to their generation and their motions does not lock them together into a solid block To use James imagery again a vast plurality of individual substances causally yet also contingently related constitutes a loosely knit world a concatenated universe

THE RELATION OF the world as a whole to God does give it greater unity if the supposition of a plurality of finite individual substances remains the fundamental feature of the world God creates The Christian doctrine of creation may attribute to the world a greater unity than that possessed by any work of human art in proportion as the infinitely greater wisdom of the divine plan orders the separate things of nature with an infinitely greater perfection than man can achieve in putting things together or in ordering them to his purpose But if according to the theologian God in creating the world creates not one substance but many substances forming a single whole through the pattern of their connection with one another then in a sense the world has less unity than each of its component substances

For Aquinas one kind of substance may have greater unity than another The immaterial has more than the material and God more than any finite substance since each of these is composed of matter and form or essence and accidents or at least of essence and existence whereas the infinite being of God is absolutely simple The divine nature is without matter without accidents its attributes are identical with its essence and its essence with its existence

This cardinal point about the divine nature is crucial to the conception of God and of the world s relation to God In the formation of Christian theology God s absolute simplicity seems to exclude all but one resolution of the issue concerning the Trinity According to the position Augustine takes in criticizing the Arian heresy the position which is expressed in the Nicene Creed God is not a trinity of substances but a trinity of persons—aspects of or relations within one substance The plurality of things which constitutes the world puts the world entirely outside the divine substance Immanent only as a cause the simple being of God transcends the complex whole of the created world

This transcendence seems furthermore to imply for theologians like Augustine and Aquinas a fundamental duality in the realm of existence God and the world are two not one Infinite being is absolutely prior to and independent of finite beings The one can exist without the many Though the many are said to participate in being when they do exist they do not enter into the being of the one or share it in any way

The being they have is not only separate from the being of God but even their mode of being is only analogical to the divine being

The doctrine that each thing has its own bein and that as Aquinas says being is com mon to all things only in an analogical sense seems to put diversity above unity in the struc ture of reality and to leave the ultimate plu rality of this world unaffected either by the fact that it was created as one or by the fact of its relation to a transcendent One

IN THE TRADITION of the great books the prob lem of the one and the many is often stated without using the notion of substance as the pivotal term

It appears in Plato s consideration of being and becoming It is sometimes present in his treatment of the relation between intelligible forms and sensible things—between the uni versal ideas and the particulars which resemble them through some manner of imitation or participation It even runs through the discus sion of the realm of ideas itself for the idea of the one is one idea among many and yet each of the many ideas is in some way one

The problem of the one and the many appears in Hume s consideration of the absolute dis tinctness of each unit of experience from every other accompanied as it is by his skepticism concerning our ability to discover any connec tions which might tie these units together into a real unity It appears in Kant s theory of the transcendental unity of apperception which reduces the sensory manifold to a unity of or der and in Hegel s theory of the one Absolute Idea which contains within itself all the variety that becomes manifest as the Idea unfolds in the processes of nature or history

The substitution of one set of terms for anoth r does not seem to alter the fundam ntal issue Nor does it enable the m nd to escape taking sides w th those who give primacy to the One or to the many except perhaps by trying to balance them as correlat ves Among the great books however the *Enneads* of Plotinus develops a theory of the One wh ch putting it above being and beyond kno ving seems to transfigure all the tradit onal terms of analy is

The One of Parmenides is after all Being and thus identification of Being with One raises a question of the reality of the many But ac cording to Plotinus there exists a Principle which transcends Being this is The One whose nature we have sought to establish so far as such matters lend themselves to proof Upon The One follows immediately the Principle which is at once Being and the Intellectual Principle Third comes the Principle Soul These are what Plotinus calls the three hypotases He finds some analogy for his trinity in a doctrine he ascribes to Plato s *Parmenides* in which he finds a threefold distinction between the Primal One a strictly pure Unity and a sec ondary One which is a One Many and a third which is a One and Many

The One according to Plotinus not only transcends being it also transcends intelligence Knowing or thinking requires an object The relation of knower and known entails a duality which would fracture the utter simplicity of The One Even the complete reflexivity of The One knowing only itself is excluded The super essential is for Plotinus also the supra cogitative

What stands above Being stands above intel lection he says it is no weakness in it not to know itself since as pure unity it contains noth ing which it needs to explore Multiplicity be g ns with the effort of the Intellectual Princ ple to know the Transcendent It knows the Transcendent in its very essence but with all its efforts to grasp that prior as pure unity it goes forth amassing successive impressions so that to it the object becomes multiple The Intell ctual Principle is established in multi plicity

What is the All of which The One is not all since the Intellectual Principle and the Soul also belong to it? Plotinus answers that The One is all things and no one of them The source of all things is not all things It is precisely because there is nothing within the One that all things are from it Everything else in the totality of which the Transcendent is the source emanates from it

Seeking nothing possessing nothing lack ing nothing Plotinus declares The One is perfect and in our metaphor has overflowed and its exuberance has produced the new this product has turned again to its begetter and has filled and has become its contemplator and so an Intellectual Principle It is simulta

neously Intellectual Principle and Being and attaining resemblance in virtue of this vision it repeats the act of the One in pouring forth a vast power This second outflow is a Form or Idea representing the Divine Intellect as the Divine Intellect represented its own prior The One This active power sprung from essences (from the Intellectual Principle considered as Being) is Soul Soul arises as the idea and act of the motionless Intellectual Principle It takes fullness by looking toward its source but it generates its image by adopting another a downward movement This image of Soul is Sense and Nature the vegetal principle

Nothing writes Plotinus is completely severed from its prior Thus the human Soul appears to reach as far down as to the vegetal order In these successive emanations all that is not One is conserved by virtue of the One and from the One derives its characteristic nature Everything except the One is a one many If it had not attained such unity as is consistent with being made up of multiplicity we could not affirm its existence The Transcendent alone is a really existent One wholly and truly One while its sequent poured down in some way from the One is all a total which has participation in unity and whose every member is similarly all and one

If reason cannot fully grasp the Transcendent One that may be because discursive reason is itself a thing of multiplicity The unity of an all-embracing vision may be required to apprehend the ineffable unity of the Transcendent. But the mysteriousness of unity is not confined to the Transcendent One It confronts the mathematician as well as the philosopher It challenges Nicomachus and Euclid as well as Plotinus

Unity writes Nicomachus occupying the place and character of a point will be the beginning of intervals and numbers but is not itself an interval or a number What then is unity or a unit in itself? Euclid answers with this definition A unit is that by virtue of which each of the things that exist is called one Unity is not only the measure of existence but also of numbers for according to Euclid a number is a multitude composed of units In mathematics no less than in metaphysics or in theolo y the relation of unity to number seems to be the heart of the problem of the one and the many

Number according to Locke applies itself to men angels actions thoughts everything that either does exist or can be imagined Unity or *one* is in his view not only the simplest of all our ideas but the most omnipresent Every object our senses are employed about every idea in our understandings every thought of our minds brings this idea along with it And therefore it is in its agreement to all other things *the most universal idea we have*

OUTLINE OF TOPICS

1 The transcendental one the Absolute the unity of being of nature of the universe

1a The relation of the one and the many emanation of the many from the one

1b The unity or duality of God and the world the immanence and transcendence of God

1c The one and the many in relation to the universal and the particular the abstract and the concrete universal

2 The modes of unity comparison of numerical essential and divine unity

2a Numerical unity or identity the number *one*

2b The unity of the indivisible or the simple the individual thing the point the atom the quality

2c The complex unity of a whole composed of parts the distinction between the indivisible and the undivided

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passage referred to For example in 4 HOMER *Iliad* BK II [6 283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12

PAGE SECTION When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

AUTHOR'S DIVISIONS One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases e g *Iliad* BK I [265 283] 12d

BIBLE REFERENCES The references are to book chapter and verse When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (D) follows e g OLD TESTAMENT *Nehemiah* 7 45—(D) *II Esdras* 7 46

SYMBOLS The abbreviation esp calls the reader's attention to one or more especially relevant parts of a whole reference passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited

Chapter 64 OPINION

INTRODUCTION

THE noble Houyhnhnms are paragons of reason They have no conceptions or ideas of what is evil in a rational nature Their grand maxim according to Swift their creator is to cultivate reason and to be wholly governed by it Neither is reason among them a point problematical as with us where men can argue with plausibility on both sides of the question but strikes you with immediate conviction as it needs must do where it is not mingled obscured or discolored by passion and interest

What Captain Gulliver finds most striking in the contrast between men and this noble race of horses is that the perfect rationality of the Houyhnhnms lifts them entirely above the vagaries and vicissitudes of opinion I remember it was with extreme difficulty he says that I could bring my master to understand the meaning of the word *opinion* or how a point could be disputable because reason taught us to affirm or deny only where we are certain and beyond our knowledge we cannot do either So that controversies wranglings disputes and positiveness in false and dubious propositions are evils unknown among the Houyhnhnms

Among men it is not the meaning of opinion but of knowledge which causes trouble If men had no conception of knowledge at all as the Houyhnhnms seem to have no conception of opinion they would find themselves disagreeing about many matters of opinion but probably not about the nature of opinion itself The great controversies concerning opinion in the tradition of western thought all relate to its distinction from knowledge both with regard to the difference in their respective objects and with regard to the way in which the mind works when it knows and when it opines

Only when something better than opinion is proposed as attainable do the characteristics of opinion come to be questioned That something may stand in relation to opinion as certainty to probability as fact to conjecture as adequate to inadequate knowledge as demonstration to persuasion The chief source of disagreement about the nature of opinion seems to be the meaning of the other term in the comparison Yet a few commonly recognized features of knowledge—if that is taken as the contrasting term—throw some light on the characteristics of opinion Certain things which are never said about knowledge seem to be generally said of opinion

AN OPINION it is said may be either true or false But knowledge is never said to be false For a great many writers though not for all doubt and belief are attitudes of mind which accompany the holding of opinion but not the possession of knowledge It is possible to opine and doubt at the same time but not to know and doubt Belief overcomes doubt with respect to opinion but in those matters in which the mind is convinced of the truth of its judgments an act of belief does not seem to be necessary

In the sense in which belief implies a willingness to assent where assent might reasonably be withheld belief seems to be appropriate to opinion but incompatible with knowledge The opposite of an opinion may be reasonably maintained whereas the opposite of that which is known must be error or falsehood and therefore untenable The traditional distinction between axioms and postulates (or assumptions) exemplifies this difference between knowledge and opinion If a proposition is axiomatic its contrary must be false But if something is proposed as an assumption to be taken for granted

then its opposite can also be postulated and probably will be postulated by those who are unwilling to grant what has been proposed

This last point in the comparison of knowledge and opinion appears to have political significance It is not merely that men are accustomed to expect more disagreement in the sphere of politics than in science they take a different attitude toward scientific and political controversy largely because one is supposed to occur in the domain of knowledge and the other in the realm of opinion Men speak of having a right to their own opinions which includes a right to persist in them despite the conflicting opinions of others. The notion of a right to a certain obstinacy in differing from one s fellow men seems to follow from the nature of opinion and to accord with its distinction from knowledge With regard to matters concerning which it is supposed that knowledge rather than opinion is possible disagreement may of course occur but never without the expectation that reasonable men should be able to reach agreement on the disputed point by re-examining the facts

The differences between men which we appeal to a consensus to resolve are differences of opinion not knowledge Sometimes conflicts of opinion cannot be settled in any other manner and for practical purposes it may be necessary to accept the opinion of the majority The theory of majority rule raises many questions on which the great books take opposite views but for the most part they restrict the application of the theory to matters of opinion Disputed issues in mathematics or other theoretic sciences are seldom if ever settled by counting heads The weight of numbers seems to be peculiarly relevant to measuring the worth of conflicting opinions

The traditional consideration of opinion naturally divides therefore into two major lines of discussion The first deals with the theoretical problem of the difference between knowledge and opinion and involves such related terms as doubt belief faith certitude and probability The second assumes that distinction for the most part and deals with the problems of decision and responsibility in the sphere of opinion—the problem of liberty of conscience of freedom of thought and expression of majorities and minorities and of individual judgment in difficult cases of conscience.

THE DISTINCTION between knowledge and opinion is sometimes made in terms of a difference in their objects and sometimes in terms of a difference in the way the mind works when it knows and when it opines These two modes of differentiation may of course supplement one another—the object of opinion being such that the mind must operate in a certain way with respect to it The same authors usually treat the matter both ways But not all the great books in which these things are discussed use the words knowledge and opinion to signify the basic opposition

Locke for example says that the mind has two faculties conversant about truth and falsehood first knowledge whereby it certainly *perceives* and is undoubtedly satisfied of the agreement or disagreement of any ideas secondly judgment which is the putting ideas together or separating them from one another in the mind when their certain agreement or disagreement is not perceived but *presumed* to be so. To the faculty of judgment belongs belief assent or opinion which is the admitting or receiving of any proposition for true upon arguments or proofs that are found to persuade us to receive it as true without certain knowledge that it is so

As demonstration is to persuasion as certainty is to probability so for Locke knowing or perceiving stands to judging or presuming Others, like Hume tend to use the term belief in the place of opinion as the opposite of knowledge or like Spinoza to assign opinion along with imagination to the domain of inadequate as opposed to adequate knowledge But such differences in vocabulary do not seem to obscure the fact that these authors are making distinctions which if not identical are at least analogous

A certain parallelism or analogy exists between different statements of the objects of knowledge and opinion The knowable seems to have the properties of necessity and immutability of universality clarity and distinctness. That which is contingent and variable or confused and obscure is usually regarded as the object of opinion

Plato for example says that that which is apprehended by intelligence and reason al ways is and has no becoming whereas that which is conceived by opinion with the help of sensation and without reason is always in a proc ess of becoming and perishing and never really is As understanding and reason divide the realm of knowledge whose object is the im mutable being of the intelligible forms so fan cy and perception divide the realm of opinion whose objects are the sensible things which come to be and perish

According to Aristotle the object of science is the essential and the necessary the object of opinion the accidental and the contingent To whatever extent sensible particulars involve contingent accidents of all sorts they belong to opinion while the intelligible essences of things universal in the sense of being common to many individuals belong to science The parallel which so far seems to be present between Plato s and Aristotle s statements of the objects of knowledge and opinion does not continue when we consider the consequences of their analyses

For Aristotle it is possible to have scientific knowledge as well as probable opinion about the changing things of the physical world to the extent that these things are both intelligible and sensible and have aspects both of necessity and contingency But for Plato the realm of becoming belongs exclusively to opinion as the quite separate realm of being belongs exclusively to knowledge In consequence Aristotle s enu m ration of the sciences includes physics along with mathematics and theology wherea the study of the physical world does not yield a sci ence according to Plato but only as he says in the *Timaeus* a likely story —a plausible composition of probable opinions

At first glance Hume seems to provide a closer parallel to Plato All the objects of human reason or enquiry may naturally be di vided into two kinds he writes *relations of ideas* and *matters of fact* Objects of the first sort are capable of demonstratively certain knowledge *e g* the mathematical sciences Matters of fact which include quest ons con cerning the real existence of anything or the causal connection of one thing with another do not permit demonstration They are objects of belief or opinion

It would seem therefore that Hume like Plato regards the objects of knowledge and opinion or science and belief as belonging to altogether distinct realms They even seem to agree that physics cannot be classified as a science though the probabilities it establishes may be quite sufficient for action But this agreement must be qualified by the fact that the realm of ideas is for Plato the reality which changing things image while for Hume ideas have no reality at all They exist only in the mind which obtains them from the impressions of sense-experience

A parallel between Hume and Aristotle might also be drawn at least insofar as both connect opinion with the contingent—that which can be otherwise If the opposite of a proposition is not impossible or does not lead to self contra diction then the proposition and its contrary are matters of opinion This criterion in Aris totle s terms excludes all self evident and de monstrable propositions Such propositions for both Hume and Aristotle expres knowledge not opinion Yet Aristotle unlike Hume does not seem to think that the real existence even of immaterial beings is indemonstrable or that no necessary connections can be discovered be tween cause and effect.

THESE EXAMPLES might be extended to include similar observations concerning Locke Spi noza Kant James —in fact almost every writer who distinguishes between knowledge and opin ion by reference to characteristically different objects In the tradition of western thought the major controversies concerning the objects of knowledge and opinion occur with regard to the kind of being or reality assigned to each type of object and in consequence with re gard to applications of the distinction One writer treats as knowledge what another by apparently the same criterion calls opinion The term opinion gets its skeptical impact from this circumstance The skeptic never den es that men can form opinions about a given sub ject he denies that the topic can be a matter of certain or unquestionable knowledge

Skepticism approaches its limit when it is maintained that e erything is a matter of op n ion At the furthest extreme it is sometimes said that nothing is e ther true or false though

Aristotle and others argue that such skepticism is self destructive since the proposition nothing is true or false is inconsequential if it is false and self contradictory if it is true But the proposition everything is a matter of opinion can itself be an opinion and its opposite an opinion also

The position which Montaigne takes in the *Apology for Raimond de Sebonde* is not the provisional skepticism of universal doubt in order to discover the foundations of certain knowledge It is rather a resolute skepticism which reduces all human judgments to the status of equally tenable opinions and gives man no hope that he will ever be able to do better than adopt opinions on insufficient grounds or else suspend judgment entirely No axioms according to Montaigne have ever won the universal consent of mankind no demonstrations have ever escaped the need to assume their initial premises Unless men beg the question in this way they cannot avoid an infinite regress in reasoning There is no proposition about which men have not disagreed or changed their minds Illusions and hallucinations suggest the pervasive unreliability of the senses as errors of judgment and reasoning suggest the radical infirmity of the mind

How variously do we judge of things? Montaigne asks How often do we alter our opinions? What I hold and believe today he continues I hold and believe with my whole belief I could not embrace nor preserve any truth with greater assurance than I do this but has it not befallen me not only once but a thousand times and every day to have embraced some other thing with the same instruments and in the same condition which I have since judged to be false? A man must at least become wise at his own expense if I have often found myself betrayed under this color if my touch prove ordinarily false and my balance unequal and unjust what assurance can I now have more than at other times? We ought to remember that whatever we receive into the understanding we often receive things that are false and that it is by the same instruments that so often give themselves the lie and are so often deceived

Montaigne exempts religious faith from the uncertainty of all beliefs or opinions which man arrives at through the unaided efforts of his senses and his reason Though we must accompany our faith with all the reason we have we must do so always with this reservation not to fancy that it is upon us that it depends, nor that our arguments and endeavors can arrive at so supernatural and divine a knowledge Faith is distinguished from ordinary belief according to Montaigne only if it enter into us by an extraordinary infusion

What is an article of faith to one man may however be merely a matter of opinion to another This seems to be generally recognized by all who differentiate religious faith from secular belief The difference lies not in the object but in the causes of belief

Those who distinguish between knowledge and opinion also admit that a difference in the way the mind judges is able to produce either knowledge or opinion concerning the same object It is impossible according to Aristotle for the same mind with regard to the same object to know and opine at the same time A given individual for example cannot hold a proposition of geometry to be true *both* as a matter of knowledge and of opinion But this does not prevent the individual who once held the proposition to be true merely on the authority of his teacher—and thus as a matter of opinion—from subsequently learning the reasons for its truth and thus coming to know what formerly he merely opined Two individuals may likewise assert the same truth in different ways the one as knowledge the other as opinion

The traditional account of the difference in the activity of the mind when it knows and when it opines appears to involve two related points The point which both Plato and Aristotle emphasize is that the man who knows does not merely assert something to be true but has adequate reasons for doing so The truth of right opinion is no less true than the truth of knowledge It differs as the discussion in Plato's *Meno* and *Theaetetus* seems to show in that the man of right opinion cannot explain why what he asserts is true He cannot give the causes of its truth or trace its connections with other truths which help to demonstrate it The fact that an opinion is true does not prevent its being overturned or given up since without adequate reasons it is insecure against attack Un

supported by reasons opinion is not only unstable as compared with knowledge but it is also unteachable in the sense in which knowledge can be learned and taught The man of right opinion unable to explain satisfactorily why he thinks as he does cannot help others understand the rightness of his opinions

The other characterization of the mind s activity in forming opinions seems to follow from the preceding observation If reasons do not determine the mind to think *this* rather than *that* what is the cause of its judgment? If the mind is not compelled by the object under consideration to think of it in a certain way what does move the mind in its act of assent or dissent to that which is proposed? To such questions the traditional answer seems to be wish or desire whether an act of free choice on the part of the will or an inclination determined by the driving power of the emotions

Pascal makes this point when he observes that there are two ways in which men come to think as they do The more natural way is that of the understanding for one should only agree to demonstrated truths but the more usual is that of the will for all men are nearly always led to believe not by proof but by inclination Hobbes similarly differentiates knowledge which rests upon definitions and demonstrations from the opinion or beliefs which the mind adopts not as the result of reasoning but by an act of will

The assent of reason is not according to Aquinas subject to command by the will in respect to all matters on which the reason can judge If that which the reason apprehends is such that it naturally assents thereto e g first principles it is not in our power to assent to it or to dissent For in such cases he holds assent follows naturally and consequently properly speaking is not subject to our command But some things which are apprehended do not convince the intellect to such an extent as not to leave it free to assent or dissent or at least suspend its assent or dissent for some cause or other and in such things assent or dissent is in our power and is subject to our command

Knowledge it would seem consists in those judgments wherein the mind is moved to assent solely by the matter being considered whereas all matters about which we are free to make up our minds one way or the other are matters of opinion

Though they vary in the terms of their analyses Descartes Locke and Hume seem also to agree that when the mind is moved to assent by the relations it perceives between ideas especially when these are clear and distinct it knows beyond doubt or the possibility of error But when the mind lacking such intuitive or rational grounds nevertheless forms a judgment concerning what is not evident then the result is opinion entertained as merely probable accompanied by doubt and subject to error

For Descartes the will freely exercised moves the mind to such fallible judgments Except when it is so moved the mind responding to its object alone is naturally infallible For Hume the mind is free to imagine whatever it pleases but its beliefs are determined by a sentiment or feeling of instinctive origin which depends not on the will nor can be commanded at pleasure The issue between those who connect opinion with free will and those who deny that beliefs are voluntarily formed is discussed in the chapter on WILL It does not seem to affect the fairly general agreement on the point that opinion is an act of the mind caused by *something other than the object itself* which the mind is considering

DOES THIS DISTINCTION between knowledge and opinion exhaustively divide all the acts of the mind? As we have seen Montaigne appears to reject both alternatives and substitutes instead supernatural faith and ordinary belief Aquinas on the other hand accepts knowledge and opinion as exhaustive on the plane of the mind s natural operations and makes religious faith a supernatural alternative to both

He calls faith a mean or intermediate between science and opinion because he conceives it as having some of the characteristics of each To believe he says is an act of the intellect assenting to the truth at the command of the will In this faith resembles opinion The act of faith is due to the will rather than to the rational evidence of the object Faith is the evidence of things unseen But faith also resembles science because the affirmations of faith have the certitude or freedom from doubt

which characterizes knowledge According to Aquinas faith has greater certitude than natural knowledge since as intellectual virtues science wisdom and understanding are based upon the natural light of reason which falls short of the certitude of God s word on which faith is founded Faith differs from knowledge in that the object of faith exceeds the intellect s comprehension That is why faith requires an act of the will to move the intellect to assent but whereas ordinary opinions are adopted by a man s own volition Aquinas attributes faith to God Faith he writes as regards the assent which is the chief act of faith is from God moving man inwardly by grace

Just as skepticism with respect to science takes the form of reducing all human judgments to opinion so skepticism with respect to religion takes the form of attributing all belief to purely natural causes If Freud is correct that all beliefs are the product of wishful thinking then it is difficult to separate religion from superstition or prejudice—or even perhaps to separate science from religion

James finds the will to believe in science as well as religion Like Freud he explains belief in terms of emotion and desire Will and Belief meaning a certain relation between objects and the Self he writes are two names for one and the same *psychological* phenomenon Except for those necessary truths which concern only ideal relationships the mind in thinking about reality is free to choose between alternative theories in the sphere of science as well as in religion To believe is to attribute reality to a theory Though the operation of the will to believe is not for James entirely independent of objective criteria neither is it mainly determined thereby

That theory will be most generally believed he says which besides offering us objects able to account for our sensible experience also offers those which are most interesting those which appeal most urgently to our aesthetic emotional and active needs So-called scientific conceptions of the universe have so far gratified the purely intellectual interests more than the mere sentimental conceptions have But they leave the emotional and active interests cold *The perfect object of belief would be a God or Soul of the World represented both optimistically and moralistically (if such a combination could be) and withal so definitely conceived as to show us why our phenomenal experiences should be sent to us by Him in just the very way in which they come*

OPINION RAISES moral and political as well as psychological issues of liberty One of them is the problem of freedom of discussion This problem has aspects which belong to other chapters—freedom in scientific inquiry to SCIENCE freedom in artistic or poetic expression to ART and POETRY freedom of conscience and worship to RELIGION freedom in teaching to EDUCATION and the general issue of freedom of thought and speech to the chapter on LIBERTY Yet what is common to all these related questions seems to be determined by the nature of opinion particularly in its distinction from knowledge

None of the books which argue for freedom of expression—Milton s *Areopagitica* Locke s *Letter Concerning Toleration* or Mill s essay *On Liberty*—defends the right to disseminate error or falsehood *knowingly* All of them argue that the individual who claims the right to be heard is morally bound by the duty to speak the truth as it appears to him Nor do those like Plato and Hobbes who recommend political censorship seek thereby to fortify the state by suppressing truth In saying that the sovereign should judge of what opinions and doctrines are averse and what conducing to peace Hobbes observes that though in matters of doctrine nothing ought to be regarded but the truth yet this is not repugnant to regulating the same by peace For doctrine repugnant to peace can no more be true than peace and concord can be against the law of nature

Since knowledge as distinct from opinion has the character of incontrovertible truth the issue of freedom or censorship cannot be stated in terms of knowledge But what some men hold to be knowledge others regard as opinion The issue of free expression applies therefore to the entire range of human thought on the supposition that *no* proposition or doctrine is exempt from controversy and no human judgment secure from contradiction This supposition does not abolish the distinction between knowledge and opinion nor does it flout the law of

contradiction by treating opposite answers to the same question as in fact equally true

If all mankind minus one were of one opinion and only one person were of the contrary opinion mankind according to Mill would be no more justified in silencing that one person than he if he had the power would be justified in silencing mankind The peculiar evil of silencing the expression of an opinion is that it is robbing the human race posterity as well as the existing generation those who dissent from the opinion still more than those who hold it If the opinion is right they are deprived of the opportunity of exchanging error for truth if wrong they lose what is almost as great a benefit the clearer perception and livelier impression of truth produced by its collision with error

Mill advances four distinct reasons for recognizing the necessity to the mental well being of mankind (on which all their other well being depend) of freedom of opinion and freedom of the expression of opinion First if any opinion is compelled to silence that opinion may for aught we can certainly know be true To deny this is to assume our own infallibility Secondly though the silenced opinion be an error it may and very commonly does contain a portion of truth and it is only by the collision of adverse opinions that the remainder of the truth has any chance of being supplied Thirdly even if the received opinion be not only true but the whole truth unless it is suffered to be and actually is vigorously and earnestly contested it will by most of those who receive it be held in the manner of a prejudice with little comprehension or feeling of its rational grounds And not only this but fourthly the meaning of the doctrine itself will be in danger of being lost or enfeebled

The aim is not to perpetuate controversy nor is it to keep all doctrines perpetually on the level of debatable opinion As mankind improve Mill writes the number of doctrines which are no longer disputed or doubted will be constantly on the increase and the well being of mankind may almost be measured by the number and gravity of the truths which have reached the point of being uncontested The cessation on one question after another of serious controversy is one of the necessary incidents of the consolidation of opinion a consolidation as salutary in the case of true opinions as it is dangerous and noxious when the opinions are erroneous

As Mill argues the case for freedom of thought and discussion it appears to be based on the hypothesis that the public debate of all matters, carried on without any restriction except those minimum restraints needed to prevent violence serves the end of separating true from false opinion and by the clarification of opinion as well as the correction of error discovering the reasons which turn opinion into knowledge It is not to multiply opinions but to advance knowledge not to encourage skepticism but to invigorate the search for truth that Mill advocates the submission of all matters to open dispute so long as any disagreement remains

His fundamental principle like that of Locke consists in divorcing political from logical criteria Logically the disputants may stand opposed to each other as one who knows and one who merely opines or as one who holds a true and one a false opinion or even as one who enjoys God s gift of supernatural faith and one who lacks such light but considered politically the opponents represent a conflict of opinion with each party equally deserving the benefit of the doubt that it may have the truth on its side If the state were to intervene it would be deciding a disputed question not by reason but by force in an area to which force is inapplicable

The business of laws Locke writes is not to provide for the truth of opinions but for the safety and security of the commonwealth and for every particular man s goods and person And so it ought to be For the truth certainly would do well enough if she were once left to shift for herself She is not taught by laws nor has she any need of force to procure her entrance into the minds of men Errors indeed prevail by the assistance of foreign and borrowed succours But if Truth makes not her way into the understanding by her own light she will be but the weaker for any borrowed force violence can add to her

Those who argue that state censorship is justified whether the matters whose debate is prohibited are speculative or practical moral

political or theological appear to extend the safeguarding of the common good beyond security from immediate peril of violence or to proceed upon the hypothesis of sufficient wisdom in the rulers to discriminate unerringly between truth and falsehood Those who distinguish between church and state with regard to censorship tend to limit the application of ecclesiastical authority to questions of faith and morals on which the church is supposed to have supernatural guidance in deciding what is true or sound

THE PRINCIPLE OF majority rule in matters of opinion seems to be opposite to the principle that the voice of a minority should be heard To settle a difference of opinion by taking a vote gives a decisive weight to numbers which it may be thought is as illegitimate as resolving a debate by force But when it is necessary to legislate or to act debate must be terminated and issues resolved

On speculative questions which may be answerable by knowledge rather than by opinion and with respect to which agreement may be possible the end of truth seems to be served by permitting discussion to go on as long as reason opposes reason But if the discussion is for the sake of determining action and if in addition the subject under discussion is strictly a matter of opinion concerning which it is possible for reasonable men perpetually to disagree then it may be necessary to appeal to some principle other than reason

Traditional political theory appears to offer only two solutions One principle of decision is to follow the opinion of a single man—an absolute monarch or an elected chief magistrate—whether or not that one man also has the wisdom commensurate with such responsibility The other principle is to accept the opinion of the majority According to Aristotle this second principle is operative in every form of government except absolute monarchy It is not only in democracy he says that the greater number are sovereign for in oligarchy and indeed in every government the majority rules It is characteristic of every form of constitutional stat they whatever seems good to the majo erests cold who share in the government be a God o authority

Considered in this way the principle of majority rule leaves open the question whether the majority should be a preponderance of the many or the few Should it be a democratic majority or according to some aristocratic standard the majority of the few who are wiser more expert or more virtuous than the many? With regard to some questions Aristotle suggests the multitude may be a better judge than any individual even the most expert If the people are not utterly degraded although individually they may be worse judges than those who have special knowledge as a body they are as good or better

The opposing claims of the greater number and the more competent as well as the possibility of combining the merits of both are discussed in the chapters on DEMOCRACY and ARISTOCRACY The problem of majority rule also appears in those chapters as a factor in the theory of representation especially the question considered by Mill—whether the representative shall exercise his own judgment or act on the opinion of the majority of his constituents.

Mill tries to separate those problems of government which should be submitted to representative assemblies and decision by majorities from those which should be solved by experts. But even on matters subject to deliberation by representatives of the people Mill advocates such measures as plural voting and minority representation to offset the sheer weight of numbers and prevent its being the decisive force in settling political differences and determining action

Such qualifications of the principle of majority rule do not seem necessary to those who hold Rousseau think that the general will is found by counting votes What Rousseau says of any individual opinion applies to minority opinions as well namely that when a contrary opinion prevails it proves that what the minority thought to be the general will was not so On the question of how large a majority should be decisive he thinks that the more grave and important the questions discussed the nearer should the opinion that is to prevail approach unanimity The more the matter in hand calls for speed the smaller the prescribed difference in the number of votes may be allowed to become

There is according to Rousseau only one political decision which requires unanimity and that is the decision to enter upon the social contract to set up popular government under which individual liberty endures as long as the qualities of the general will still reside in the majority When the principle of majority rule is unanimously adopted each individual agrees to substitute the general will for his own particular opinion

OUTLINE OF TOPICS

REFERENCΣS

To find the passages cited use the numb rs in heavy type which are the volume and pag number of the passages referred to For example in 4 Homer *Iliad* bk ii [265 283] 12d the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12

Page Sections When the text is printed in one column the letters a and b refer to the upper and lower halves of the pa e For example in 53 J mes *Psychology* 116a 119b the passa begins in the upper half of p ge 116 and ends in the lower half of page 119 When the text is printed in t o columns the lette s a and b refer to the upper and lo er halves of the left hand side of the page the lette s c and d to the upper and lower halves of the right hand side of the page For example in 7 Γ l. to *Symposium* 163b-164c the passage begins in the lower half of the left hand side of page 163 and ends n the upper half of the right hand side of pa e 164

Author s Divisions One or more of the main divi ions of a work (such as part bk, ch sect) are sometimes included in the reference line numbers in brackets are given in certain cases *e g Il ad* bk ii [265 283] 12d

Bibl References The references re to book chapter and verse When the Kin James and Douay versi ns d fler in title of books or in the numbering of chapters or verses the King James ersion is cited first and the Douay nd cated by a *(D)* follo s *e g* Old Testament *Nehem ah* 7 45—*(D) II Esd as* 7 46

Symbols The abbre iat on esp alls the reader s attention to one or more especially relevant parts of a hole refere ce passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited

For add t onal information concerning the style of the references see the Explanation of Reference Style for general gu dance in the use of *The Great Ideas* consult the Preface

Chapter 65 OPPOSITION

INTRODUCTION

CERTAIN words in the vocabulary of com mon speech used at almost every turn of discourse indicate ideas so indispensable to hu man thou ht that they are often employed without analysis The word is is one of these si nifying the idea of being or existence The word not and the pair of words either or have the same character Taken together not and either or signify the idea of opposition The quality of redness is *not* the same as the quality of hotness yet this negative relation by itself does not mal e them opposite for something can be red hot It is only when a thing can have *either* one quality *or* another but *not* both that the qualities are said to be op posed Opposites are more than merely dis tinct they exclude one another

Opposition seems to be as pervasive as the familiar words which signify it Even if it were not itself one of the great ideas it would be man fest in all the other basic notions which come in ant thetical pairs *e g* good and evil life and death war and peace universal and particular pleasure and pain necessity and contingency same and other one and many virtue and vice Each of these notions eems to imply its opposite and to draw its meaning from the opposition There are other terms in tl e list of great ideas which though not paired in the same chapter stand oppo ed to one another art to nature chance to fate liberty to slavery time to eternity knowledge to opinion matter to form democracy to oligarchy and similarly other forms of government Still other terms cannot be discussed without reference to their oppos tes even though we have not explicitly l sted them such as being and non bein truth and falsity love and hate justice and injustice wealth and poverty

The enumeration mi ht extend to include every fundamental notion except for the in convenience in certain cases of not having read ily familiar names to designate the opposites In some instances moreover the opposition seems to involve more than a pair of terms as for ex ample is the case with poetry history and sci ence or physics mathematics and metaphysics

In the tradition of the great books we not only find the opposition of one idea to another but we also find opposite points of view conflicting theories or doctrines in the discussion of almost every basic topic under the heading of these ideas We find the same word used with contrary meanings the same propo sition affirmed and denied We find reasoning oppo ed to reasoning The same conclusion is reached from apparently opposite principles or opposite conclusions are drawn from premises apparently the same

But though opposition seems to be inherent in the realm of ideas and in the life of thought the idea of opposition is not itself explicitly thou ht about in many of the great books This does not mean that in the consideration of other matters the significance and consequences of opposition go unnoted On the contrary all the chapters dealin with the nature and con duct of man or with the institutions and h s tory of so iety give evidence of the general recognition—by poets and historians by cien tists and philosophers—that opposit on in the form of active confl ct characterizes the phe nomen The fact of warring opposites not only enters into descriptions of the way things are but also poses problems for psychologists mor alists economists and statesmen to solve

The study of nature as well as of m n a d society discovers opposition at the root of change The physics of antiquity for ex mple defines the elements or th bod ly humours in terms of contrary qual t es ac ording to Aris totle contra ies are among the

ciples of nature—the terms of change The cosmology of Lucretius makes the conflict of opposites the principle of growth and decay in the universe Destruction struggles against creativity life against death The death dealing motions the poet writes cannot keep the mastery always nor entomb existence for ever more nor on the other hand can the birth and increase giving motions of things preserve them always after they are born Thus the war of first beginnings waged from eternity is carried on with dubious issue now here now there the life bringing elements of things get the mastery and are overmastered in turn

Modern mechanics deals with action and reaction in the impact of bodies and the resolution of forces tending to produce opposite results The theory of evolution pictures the world of living organisms as engaged in the struggle for survival organism competing with organism or against an adverse environment for the means of subsistence or reproduction

These indications of the prevalence of conflict in the realm of thought itself or as a fundamental conception in man s thinking about nature and society do not alter the point that only in logic or metaphysics is opposition abstracted from special subject matters to become itself the object of thought Even so not all of the great speculative works develop an explicit theory of opposition—classifying its types analyzing its structure formulating it as a universal principle of being mind or spirit

Four authors especially treat opposition as a primary theme though not out of the context of such other notions as being relation one and many same and other or identity and difference They are Plato Aristotle Kant and Hegel It should not be surprising that the same authors are the principal figures in the chapter on DIALECTIC Their disagreement about the nature or meaning of dialectic has a parallel here in their conflicting theories of opposition

SOCRATES ARGUES in the *Protagoras* for the unity of virtue by using the principle that everything has one opposite and not more than one If wisdom is the opposite of folly and if it also appears that folly is opposed by temperance then either wisdom and temperance are the same or a thing may have more than one opposite Protagoras reluctantly accepts the first alternative he is apparently unwilling to re open the question concernin th pairing of opposites But the question is reopened by others It is one of the great problems in the theory of opposition relevant to the distinction of different kinds of opposites.

The problem can most readily be stated in terms of the logical processes of division and definition On the hypothesis that opposites always come in pairs every class can be divided into two sub classes which not only exclude each other but also exhaust the membership of the divided class. Such division is called dichotomy Many of the Platonic dialogues—notably the *Sophist* and the *Statesman*—exemplify the method of dichotomous division used as a device for constructing definitions. The object to be defined the character of the statesman or the sophist is finally caught in the net of classification when division after division having been made two sub classes are reached whi h leave no other possibilities open The thin is either one or the other

In the *Sophist* a preliminary exercise is undertaken in the method of division as preparation for the use of this method to define the sophist It will serve us here as an example of dichotomy All the arts are first divided into two kinds the productive and the acquisitive then the acquisitive arts are divided into those making voluntary exchanges and those which obtain goods by coercion the coercive divides into fi hting and hunting according to the alternatives of open or secret attack hunting into the hunting of the lifeless and the living hunting of the living into hunting of swimming or walking animals the hunting of swimming animals into the hunting of winged animals and the huntin of water animals the hunting of water animals into opposite methods of catching fish with further sub-divisions made until the art of angling can be defined as an acquisitive art wh ch being coercive is a form of hunting distinguished from other forms of hunting by the character of its object—animals which swim in water rather than air—and by the method used to catch them—hooks or barbs rather than nets or baskets

Aristotle objects to this process of division as a way of defining things Some writers he

says propose to reach the definitions of the ultimate forms of animal life by bipartite division But this method is often difficult and often impracticable For one thing it tends to associate or dissociate natural groups arbitrarily *e g* the classification of birds with water animals or of some birds with fish and some birds with land animals If such natural groups are not to be broken up the method of dichotomy cannot be employed for it necessarily involves such breaking up and dislocation

Aristotle also calls attention to the fact that the method of dichotomy often uses negative terms in order to make an exhaustive division into two and only two sub classes But the class which is formed by a negative characterization cannot be further sub-divided There can be no specific forms of a negation of featherless for instance or of footless as there are of feathered and of footed It is impossible Aristotle says, to get at the ultimate specific forms of animal life by bifurcate division He therefore proposes a method of defining by genus and difference accord ng to which it is possible in biological classificat on to sub-divide a genus into more than two spe ies To avoid sub division into two and only two that which differentiates each species from the others within the same genus must be some positive characteristic

As ALTERNATIVE methods of definition dichotomous division and the differentiation of species within a genus are discussed in the chapter on DEFINITION Here we are concerned with the problem of the number of opposites produced by the exhaustive division of a class or kind For example how many species of color are there? If the primary colors are more than two it would appear that each primary color has more than one opposite since the same object at the same time and in the same respect cannot be both red and yellow red and green green and yellow But Aristotle seems to restrict the notion of contrariety to pairs of opposite qualiti s Red yellow and such colors though qualities have no contraries he says Whether or not he would have rega ded them as contraries if he had been acquainted with the chromatic series of the spectrum remains a conjecture

To find a s ngle opposite for red it is necessary to employ the negative term not red But then another difficulty arises which Aristotle recognizes when he calls the negative term indefinite and which Kant discusses when he treats the infinity of the negative The not red includes more than other colors which are not red such as green and yellow It includes every thing in the universe colored or colorless which is *not* red *e g* happiness or atoms or poetry

Perfect dichotomy can be achieved by using positive and negative terms as opposites or what Aristotle sometimes calls contradictory terms —such as man and not man or just and not just But the class which is thus divided is absolutely indeterminate It is the universe everything the infinite It is necessary further more to distinguish between the opposition of just and not just and the opposition of just and unjust The term unjust is the contrary rather than the contradictory of just for these opposites apply only to men or laws or acts only certain kinds of things are either just or unjust and that is why it is said that contraries are always opposites within a genus or a definite kind In contrast not just is the contradictory rather than the contrary of just for these opposites apply to everything in the uni erse everything is either the kind of thing to which just and unjust apply or it is the kind of thing to which neither of these terms apply and so it is the not just

In addition to separating contraries (both of which are positive terms) from contradictory opposites (one of which is a positive the other a negative term) Aristotle distinguishes two sorts of contraries On the one hand such contraries as odd and even exhaustively divide a limited class (*e g* integral numbers) on the other hand such contraries as white and black represent the extremes of a continuous series of shades in which any degree of grayness can be cons dered as the opposite of either extreme or of a darker or a lighter gray

There are still other kinds of opposite pairs accord ng to Aristotle such as the terms double and half which have the peculiarity of implying each othe or the term blindnes and s ght which are opposite condit ons of the sam subject In this last case on of th opposites naturally belong to a certa n kind of

ays propose to reach the definitions of the ultimate forms of animal life by bipartite division But this method is often difficult and often impracticable For one thing it tends to associate or dissociate natural groups arbitrarily e g the classification of birds with water animals or of some birds with fish and some birds with land animals If such natural groups are not to be broken up the method of dichotomy cannot be employed for it necessarily involves such breaking up and dislocation

Aristotle also calls attention to the fact that the method of dichotomy often uses negative terms in order to make an exhaustive division into two and only two sub-classes But the class which is formed by a negative characterization cannot be further sub-divided There ~ uay no specific forms of a negation y and either for instance or of footless as for example All ered and of footed It is licted by Some men says to get at the ultimd in a merely contrary animal life by bifurcate d vhite The latter is a proposes a method of defin since it permits the ference according to whicl the truth of a third logical classification to subi are white and some more than two species To by a contradiction into two and only two that way each species from the otherists and God does genus must be some positivd a beginning and beginning consti

As ALTERNATIVE methods of o h there seems to omous division and the differe o make a differ ies within a genus are d scu great controver DEFINITION Here western thought to problem of the num te views which men d by the exhaustiv tal issues are genuine For example how everyone to take sides e? If the primar rely contrary positions would appear ve the inconsistency of than one op s us from agreeing with he same tim ispute but it does not re be both red th either for contrary doc d yellow pst the possibilities Between ion of con itions for example as that Red yux and nothing chan es both have no co true the truth may lie in he would b e elements of permanence he had been ange or it may be in the ries of the becom ng that lacks per of being that is free f om

sary to employ the negative term not red But then another difficulty arises which Aristotle recognizes when he calls the negative term indefinite and which Kant discusses when he treats the infinity of the negative The not red includes more than other colors which are not red such as green and yellow It includes every thing in the universe colored or colorless which is *not* red e g happiness or atoms or poetry

Perfect dichotomy can be achieved by using positive and negative terms as opposites or what Aristotle sometimes calls contradictory terms —such as man and not man must not the not just But the clas conclusion be false—or at absolutely it s be incapable of demonstration by propositions which are also necessarily true?

On both these questions Kant and Aristotle seem to be opposed According to Aristotle no truths are necessary or axiomatic unless their contradictories are self contradictory But Kant makes a distinction between analytical and synthetical propositions (discussed in the chapter on JUDGMENT) and in terms of it he restricts the principle of contradiction to serving as a criterion of truth for analytical judgments alone In an analytical judgement he writes whether negative or affirmative its truth can always be tested by the principle of contradiction But though we must admit Kant continues that the principle of contradiction is the general and altogether sufficient principle of all analytical knowledge beyond this its authority and utility as a sufficient criterion of truth must not be allowed to extend In the synthetical part of our knowledge we must no doubt take great care never to offend against that inviolable principle but we ought n ver to expect from it any help with regard to the truth of this kind of knowledge

The reason Kant explains is that in forming an analytical judgement I remain within a given concept while predicating something of it If what I predicate is affirmative I only predicate of that concept what is already contained in it if it is negative I only exclude from it the opposite of it For example if the mean ng of the concept whole involves being greater than a part self contrad ction r sult from denying that the wl ole is greater than a

In forming synthetical judgements on the contrary I have to go beyond a given concept in order to bring something together with it which is totally different from what is contained in it Here Kant declares we have neither the relation of identity nor of contradiction and nothing in the judgement itself by which we can discover its truth or its falsehood for example the judgment that everything which happens has a cause The truth of such synthetical judgments according to Kant is as necessary and as *a priori* as the truth of analytical judgments but the principle of contradiction does not provide their ground or validation

For Aristotle in contrast those propositions which do not derive necessity from the principle of contradiction belong to the sphere of opinion rather than to the domain of knowledge They can be asserted as probable only not as true or false In the domain of knowledge it is impossible to construct valid arguments for contradictory conclusions for if one must be true and the other false one can be validly demonstrated and the other cannot be demonstrated at all But in the sphere of opinion dialectical opposition is possible Because the contradictory of a probable statement is itself also probable probable arguments can be constructed on the opposite sides of every dialectical issue

For Kant dialectical issues do not consist in a conflict of opposed probabilities Far from setting probable reasoning against probable reasoning dialectical opposition consists in what appear to be *demonstrations* of contradictory propositions For example in that part of the *Critique of Pure Reason* devoted to the Transcendental Dialectic Kant presents opposed arguments which look like demonstrations of contradictory propositions—such as the thesis that the world has a beginning in time and its antithesis that the world has no beginning or the thesis that there exists an absolutely necessary being and its antithesis that there nowhere exists an absolutely necessary being These are two of the four issues which Kant calls the antinomies of a transcendental dialectic

Such issues Aristotle would agree with Kant do not belong to the sphere of opinion or probability But Kant would not agree with Aristotle that such issues belong to the domain of science or certain knowledge The problem of the world s beginning or eternity for example is one which Aristotle treats in his *Physics* and appears to think is solved by the demonstration that motion can have neither beginning nor end The problem of the existence of a necessary being is one which Aristotle treats in his *Metaphysics* and which he also appears to think is capable of a demonstrative solution For him therefore both are problems to which scientific answers can be given But for Kant the demonstration of the antitheses or contradictory propositions in both cases is as cogent as the demonstrations of the theses and therefore since we know that both of a pair of contradictory propositions cannot be validly demonstrated we must conclude that the arguments advanced are only counterfeit demonstrations or as Kant says illusory He calls these demonstrations dialectical and the issues they attempt to resolve antinomies precisely because he thinks the reasoning goes beyond the limits of scientific thought and because he thinks the issues are problems reason cannot ever solve

With respect to conclusions affirming or denying matters beyond experience the antinomies can be interpreted either as showing that contradictory arguments are equally sound or as showing that they are equally faulty On either interpretation Kant and Aristotle seem to be opposed on the applicability of the principle of contradiction to conflicting arguments and conclusions (except of course those which are merely probable) This difference between them accords with the difference in their conceptions of science and dialectic and in their theories of the scope and conditions of valid knowledge

THE OPPOSITION between Kant and Aristotle may not present the only alternatives Hegel s theory of the dialectical process seems to offer a third Where Aristotle appears to think that all contradictions must be resolved in favor of one of the opposites and where Kant appears to think that some contradictions cannot be resolved at all Hegel proposes the resolution of all contradictions not by a choice between

them but by a synthesis uniting the opposites and reconciling their differences

According to Aristotle opposites exclude one another in existence as well as in thought A thing cannot both exist and not exist at the same time nor in any particular respect can it simultaneously both be and not be of a certain sort Only with the passage of time and in the course of change can opposites be realized when a thing passes from being to non being or gives up one attribute in order to assume its contrary

The difference for Aristotle between becoming and being (or between change and complete actuality) seems to be that the one includes and the other excludes opposites Change cannot occur except as one opposite comes into existence *while* the other passes away But opposites cannot co exist with complete actuality So far as reality consists of co-existent actualities it is limited by the principle of contradiction—as a principle of being—to those which are not contradictory All possibilities cannot therefore be simultaneously realized for as Leibnitz states the principle all possibilities are not compossible

According to Hegel every finite phase of reality—everything except the Absolute Idea itself—has its contradictory as real as itself and co-existent with it Contradictories imply one another and require each other almost as correlative opposites do Whatever is partial and incomplete presupposes something which is partial and incomplete in an opposite respect The opposition between them can therefore be overcome by a synthesis which includes them both and which complements each by uniting it with the other

For example the category of being is opposed by non being These opposites both exclude and imply one another They are in a sense even identical with one another insofar as the notion of being contains the notion of non being and conversely the notion of non being the notion of being Except for the Absolute everything which is also is not and everything which is not also is The apparent contradiction involved in this simultaneous application of opposite categories to the same thing is overcome by a third category becoming which is the synthesis of being and non being Being and non being are united in becoming

This reconciling of opposites by their union in a more inclusive whole embracing both typifies the Hegelian dialectic of thesis antithesis and synthesis The motion repeats itself as the synthesis of one contradiction faces its own opposite and requires a higher synthesis to overcome the contradiction it has generated Thus every opposition in reality or thought is a phase in the progressive realization of the Absolute wherein all contradictions are resolved

In Hegel s *Philosophy of History* and in his theory of the development of the state in the *Philosophy of Right* the dialectical process is exemplified at every stage of progress The conflict of interdependent opposites—of opposite classes or forces in society of opposite political institutions or principles—calls for a resolution which shall unite rather than exclude the opposites

Considering the division of labor for example Hegel writes When men are dependent on one another and reciprocally related in their work and the satisfaction of their needs subjective self seeking turns into a contribution to the satisfaction of the needs of everyone else That is to say by a dialectical advance subjective self seeking turns into the mediation of the particular through the universal with the result that each man in earning producing and enjoying on his own account is *eo ipso* producing and earning for the enjoyment of everyone else The opposition between the particular good of each individual and the universal good of all is thus overcome by that advance in social organization which is the division of labor

Each of the stages of world history is according to Hegel the presence of a necessary moment in the Idea of the world mind But the world mind itself is a synthesis a resolution of the confli ting opposites—of the various national minds which are wholly restricted on account of their particularity Their deeds and destinies in their reciprocal relations to one another are the d alectic of the finitude of these minds and out of it arises the universal mind the mind of the vorld f ee from all restr ct ons producing itself as that wh ch exercises its right —and its right is the high st right of all—ov r these finit m nds in the h tory of tl e world which is the wo ld s court of judgment

Chapter 66 PHILOSOPHY

INTRODUCTION

THE difficulties which attend the consideration of any great idea—by philosophers or others—appear with peculiar force in the traditional discussion of philosophy itself The word philosophy not only varies in its descriptive significance now designating one part of learning now another and sometimes even an attitude of mind or a way of life but it also varies as a term of evaluation It is seldom used without expressing either praise or dispraise of the methods and accomplishments of philosophy or of the calling and character of the philosopher

On the descriptive side the meaning of the word ranges from a conception of philosophy which covers *all* branches of scientific knowledge and which contrasts philosophy with poetry history and religion to a conception of philosophy in which the primary point is its contrast to science and its association with poetry and religion as works of vision speculation or belief rather than of knowledge

On its evaluative side the word philosophy sometimes eulogizes the love and search for truth the pursuit and even the attainment of wisdom At the other extreme it derogates vain learning idle disputation and the dogmatism of unsupported opinion At one time the good name of the philosopher stands in contrast to the questionable reputation of the sophist At another philosopher carries almost the same invidious connotation as sophist The dismissal of philosophy as useless or at best ornamental in the practical affairs of society is sharply opposed to the vision of an ideal state which can come to pass only if philosophers are kings or kings philosophers

THESE SHIFTS IN the meaning of the words philosophy and philosopher record crises in the history of western thought They reflect the characteristic formations of our culture in its major epochs

The great books of antiquity for example seem to give no intimation of a division between science and philosophy Particular bodies of knowledge such as physics or mathematics are indifferently regarded as sciences or branches of philosophy The crown of knowledge is wisdom approached as one rises in the hierarchy of knowledge to the highest science or the first philosophy Aristotle and Plato may disagree in naming or defining the type of knowledge which deserves to be called wisdom yet for both it is the ultimate attainment of philosophical inquiry or scientific work

The differences between Plato and Aristotle discussed in the chapters on DIALECTIC and METAPHYSICS—the one using dialectic as the name for the supreme form of knowledge the other using theology to name the summit of the sciences—do not affect their agreement that the philosopher is a man of knowledge not opinion and that his ultimate goal is wisdom

If there is any distinction in antiquity between science and philosophy it seems to find expression in the sense in which Socrates speaks of philosophy as the love of wisdom implying thereby its pursuit rather than its attainment A man would not be called a scientist in a particular field—mathematics let us say—unless he actually had some mathematical knowledge but a man who is not actually wise can be called a philosopher by virtue of his effort to become wise Apart from this point of distinction the Greeks tend to identify philosophy with the fundamental sciences which somehow yield speculative or practical wisdom

Considering the whole of human learning all its arts and disciplines we see that the things the ancients distinguish from philosophy are poetry history and the particular productive

arts or crafts Here again Plato and Aristotle do not make the distinction in the same terms Plato compares the poet unfavorably with the philosopher in the *Republic* The poet is an imitator of imitations and moves on the level of images and beliefs whereas the philosopher rises above the imagination to the level of ideas which are the only true objects of knowledge Aristotle on the other hand seems to pay poetry a compliment when in the *Poetics* he says that it is more philosophical than history because it deals with the universal rather than the particular These attitudes toward poetry in relation to philosophy are somewhat reversed by the fact that for Plato myth and poetry provide materials from which philosophical insights can sometimes be distilled whereas for Aristotle sense *experience is the source from which by* induction the principles or axioms of philosophical knowledge are obtained Despite these differences their accord on the supremacy of the philosopher remains unaffected

More than poetry and history—and all the knowledge that can be applied productively—philosophy represents the highest use of man s faculties On this Aristotle and Plato seem to be agreed even though Aristotle distinguishes the philosophical from the political life and assigns the most perfect happiness to the contemplative activity of the philosopher whereas Plato—in the *Republic* at least—brings the philosopher back to the shadows of the cave after he has seen the light of truth itself so that he can put his wisdom to practice in the government of his less fortunate fellow man

THE PRACTICE OF philosophy seems to become for the Roman writers more important than the content of philosophy as a body of doctrine What is that wh ch is able to conduct a man ? asks Marcus Aurelius One thing and only one philosophy It keeps the inner man free from violence and unharmed superior to pains and pleasures doing nothing without a purpose It enables him to accept all that happens and all that is allotted and finally to wait for death with a cheerful mind as be ng nothing else th n a d solution of the elements of which every living being is compounded To Aurel us his imperial court is like a stepmother to whom one must be dutiful ph losophy like a mother from whom one gains solace and help Return to philosophy frequently and repose in her he tells himself so that what thou meetest with in the court appears to thee tolerable and thou tolerable in the court

The Stoic conception of philosophy as a moral discipline and as a consolation creates that sense of the word in which the familiar injunction to a person in distress— Be philosophical — carries the same meaning as Be stoical Philosophy provides only peace of mind not worldly riches or external power Philosophy does not promise to secure to man anything outside himself says Epictetus Nor does it fulfill its promise of inner strength without stern resolution to withdraw desire from the *goods of fortune*

Do you suppose that you can be a philosopher if you do as you do now? Epictetus asks Do you suppo e that you can eat and drink as you do now and indulge your anger and displeasure just as before? No you must sit up late you must work hard conquer some of your desires When you have carefully considered these drawbacks then come to us if you are willing to pay this price for peace of mind freedom tranquility Do not try to be first a philosopher then a tax collector then an orator then one of Caesar s procurators These callings do not agree You must be busy either with your inner man or with things outside that is you must choose between the position of a philosopher and that of an ordinary man

There seems to be no difference between the Stoic and Epicurean conception of philosophy Lucretius praises Epicurus thanks to whom s eet solaces of life soothe the mind for as soon as his philosophy begins to proclaim aloud the nature of things the terrors of the mind fly away

But for Lucretius philosophy achieves this boon not merely by curbing the passions and quieting desires but also and primarily by the truth of its teach ngs about the constitution of the world and the causes of th ng Nor is it merely that the ph losophical mind is able t dwell in the calm h gh pl fi mly on the he hts by the teach ng of whence you can look do vn on

them wandering hither and thither going astray as they seek the way of life Philosophy provides a more specific remedy for the deepest of human ills by freeing the mind from the close bondage of religion

Men fear the thunderbolts of the gods their intervention in the course of nature and human affairs and the punishments of the after life Before Epicurus taught them the mortality of the soul and the atomic determination of all things the life of man lay foul to see and grovelling upon the earth crushed by the weight of religion His teaching concerning what can come to be and what cannot and in what way each thing has its power limited rids the mind of the terrors fostered by religion This darkness of mind must needs be scattered by the outer view and the inner law of nature

Except for Lucretius the triumph of philosophy over religion does not seem to be central to ancient conceptions of philosophy s contribution to the mind and life of man In the pagan world religious belief is either combined with philosophy to constitute the worship of the gods which seems to be Plato s view in the *Laws* or it represents the superstitions of the ignorant as opposed to the sophistication of the educated Gibbon describes the rift between religion and philosophy not as a matter of intellectual controversy but as a division of society into classes lacking or having the benefits of education—or what is the same in the ancient world instruction in philosophy

But in the mediaeval world the distinction between philosophy and religion seems to be essential to the consideration of the nature and value of philosophy The importance of the distinction appears alike in the great books of the Christian tradition and in the great writings of the Mohammedan and Jewish cultures—in Augustine and Aquinas Avicenna Averroes and Maimonides—though the problem of philosophy s relation to religion and theology may be quite differently solved by each In all three religious communities secular learning and sacred doctrine are set apart by their origin—the one from the efforts of human reason the other from the word of God as revealed to the faithful Even when it is held in highest esteem as the best achievement of secular learning philosophy is for the most part regarded as inferior to the teachings of religion

There are those—the simply religious the devout the mystical—who abominate the pretensions of reason and the vanity of philosophers who claim either merit or need for any knowledge beyond the truths which God himself has revealed This position is expressed by such Christian writers as Tertullian Peter Damascene Bernard of Clairvaux or in the Arabic tradition by Al Ghazzali s *The Destruction of Philosophy* Al Ghazzali is answered by Averroes in his *Destruction of the Destruction* which asserts the supremacy of philosophy Averroes reserves philosophy for men of requisite intellectual strength and relegates theology and religion to those who must substitute opinion and imagination for reason

Neither Augustine nor Aquinas goes to these extremes They do not dismiss philosophy as useless learning or as dangerous folly subversive of the wisdom of faith but neither do they admit the sufficiency of philosophy for know edge of God—the mysteries of the divine natu God s providence and His gracious gift of salvation to man

Quoting St Paul s warning to beware lest any man spoil you through philosophy and vain deceit according to the tradition of men and the rudiments of the world and not accordin to Christ Augustine defends his praise of the Platonic philosophy which in his judgment comes nearest to the Christian faith on the ground that the Apostle also said to the gentiles that that which is known of God is manifest among them for God has manifested it to them Yet he adds that the Christian man who is ignorant of their writings is not therefore ignorant that it is from the one true and supremely good God that we have that nature in which we are made in the image of God and that doctrine by which we know Him and ourselves and that grace with which by cleaving to Him we are blessed

Philosophy according to Augustine can thus be dispensed with in all the major concerns of knowledge love or action But Augustine does not argue that it should therefore be discarded he says If those who are called philosophers and especially the Platonists have said aught that is true and in harmony with our faith we

are not only not to shrink from it but to claim it for our own use from those who have unlawful possession of it even as the spoils of the Egyptians belong to the Jews

Though Augustine and Aquinas conceive the relation of faith and reason differently they seem to share a conception of philosophy as the handmaiden of theology when faith seeks understanding For Aquinas this does not appear to imply lack of dignity or even the lo s of a certain autonomy on the part of philosophy On the contrary so highly does he regard the demonstrations of Aristotle whom he calls the philosopher that he opens the *Summa Theologica* with the question Whether besides th philosophical sciences any further doctrine is required.

He answers that it was necessary for the salvation of man that certain truths which exceed human reason should be made kno vn to him by divine revelation Even as regards those truths about God which human reason can investigate it was necessary that man be taught by a divine revelation For the truth about God such as reason can know it would only be known by a few and that after a long time and with the admixture of many errors whereas man s whole salvation which is in God depends upon the knowledge of this truth It was therefore necessary that besides the philosophical sciences investigated by reason there should be a sacred science by way of revelation. That sacred science is theology—not the theology which is a part of philosophy but the theology whose princ ples come from faith rather than from reason

There is no reason Aquinas writes why those th ngs which are treated by the philosophical sciences so far as they can be known by the li ht of natural reason may not also be treated by another science so far as they are known by the light of the divine revelation On this view sacred theology may treat of certain things such as the mystery of the Trinity which do not belong p operly to the philosopher because they exceed the power of reason to demonstrate but other matte s concerning nature man and God may belong both to the philosopher and to the theologian who consider them accord ng to their different l ghts Since a truth cannot conflict with a truth though reason sponsors one and faith the other there can be no conflict between philosophy and theology

SOME MODERN philosophers like Bacon and Locke seem to agree with mediaeval theologians about the subordination of philosophy to theology But for the most part the modern tendency increasingly evident in the writings of Descartes Spinoza Kant and Hegel is to insist upon the complete autonomy of philosophy

Hegel for example challenges the imputation against Philosophy of being shy of noticing religious truths or of having occasion to be so and the insinuated suspicion that it has any thing but a clear conscience in the presence of these truths So far from this being the case Hegel remarks the fact is that in recent times Philosophy has been obliged to defend the domain of religion against the attacks of several theological systems

The diverse aspects of the problem of the relation of philosophy to theology and of theology to faith are discussed in the chapters on METAPHYSICS THEOLOGY and RELIGION The problem which is more characteristic of the modern consideration of philosophy concerns its relation to science

To state the problem some distinction between the two is necessary and making this distinction represents a novel departure both in thought and language As we have seen philosophy and science are almost identified throughout the ancient and mediaeval tradition Insofar as the word science means knowledge rather than opinion the result of philosophical inquiry is science and philosophy as a whole is divided into a number of sciences There may be as anc ent writings seem to suggest sciences which aim at useful productions rather than at speculative or practical wisdom and fall below the level of ph losophy or there may be as some Christian theologians hold a sacred science superior in its wisdom to all the philosophical sc ences But these exceptions to the identity of philosophy and science merely confirm the point that in the ancient o mediaeval v ew philosophy is scientific and consists of sciences even though there may be sciences which are not ph losophi al

This use of the words science and philos-

them wandering hither and thither going astray as they seek the way of life Philosophy provides a more specific remedy for the deepest of human ills by freeing the mind from the close bondage of religion

Men fear the thunderbolts of the gods their intervention in the course of nature and human affairs and the punishments of the after life Before Epicurus taught them the mortality of the soul and the atomic determination of all things the life of man lay foul to see and grovelling upon the earth crushed by the weight of religion His teaching concerning what can come to be and what cannot and in what way each thing has its power limited rids the mind of the terrors fostered by religion This darkness of mind must needs be scattered by the outer view and the inner law of nature

Except for Lucretius the triumph of philosophy over religion does not seem to be central to ancient conceptions of philosophy s contribution to the mind and life of man In the pagan world religious belief is either combined with philosophy to constitute the worship of the gods which seems to be Plato s view in the *Laws* or it represents the superstitions of the ignorant as opposed to the sophistication of the educated Gibbon describes the rift between religion and philosophy not as a matter of intellectual controversy but as a division of society into classes lacking or having the benefits of education—or what is the same in the ancient world instruction in philosophy

But in the mediaeval world the distinction between philosophy and religion seems to be essential to the consideration of the nature and value of philosophy The importance of the distinction appears alike in the great books of the Christian tradition and in the great writings of the Mohammedan and Jewish cultures—in Augustine and Aquinas Avicenna Averroes and Maimonides—though the problem of philosophy s relation to religion and theology may be quite differently solved by each In all three religious communities secular learning and sacred doctrine are set apart by their origin—the one from the efforts of human reason the other from the word of God as revealed to the faithful Even when it is held in highest esteem as the best achievement of secular learning philosophy is for the most part regarded as inferior to the teachings of religion

There are those—the simply religious the devout the mystical—who abominate the pretensions of reason and the vanity of philosophers who claim either merit or need for any knowledge beyond the truths which God himself has revealed This position is expressed by such Christian writers as Tertullian Peter Damian Bernard of Clairvaux or in the Arabic tradition by Al Ghazzali s *The Destruction of Philosophy* Al Ghazzali is answered by Averroes in his *Destruction of the Destruction* which asserts the supremacy of philosophy Averroes reserves philosophy for men of requisite intellectual strength and relegates theology and religion to those who must substitute opinion and imagination for reason

Neither Augustine nor Aquinas goes to these extremes They do not dismiss philosophy as useless learning or as dangerous folly subversive of the wisdom of faith but neither do they admit the sufficiency of philosophy for knowledge of God—the mysteries of the divine nature, God s providence and His gracious gift of salvation to man

Quoting St Paul s warning to beware lest any man spoil you through philosophy and vain deceit according to the tradition of men and the rudiments of the world and not according to Christ Augustine defends his praise of the Platonic philosophy which in his judgment comes nearest to the Christian faith on the ground that the Apostle also said to the gentiles that that which is known of God is manifest among them for God has manifested it to them Yet he adds that the Christian man who is ignorant of their writings is not therefore ignorant that it is from the one true and supremely good God that we have that nature in which we are made in the image of God, and that doctrine by which we know Him and ourselves and that grace with which by cleaving to Him we are blessed

Philosophy according to Augustine can thus be dispensed with in all the major concerns of knowledge love or action But Augustine does not argue that it should therefore be discarded. If those who are called philosophers he says and especially the Platonists have said aught that is true and in harmony with our faith, we

are not only not to shrink from it but to claim it for our own use from those who have unlaw ful possession of it even as the spoils of the Egyptians belong to the Jews

Thou h Augustine and Aquinas conceive the relation of faith and reason differently they seem to share a conception of philosophy as the handmaiden of theology when faith seeks un derstanding For Aquinas this does not appear to imply lack of dignity or even the loss of a certain autonomy on the part of philosophy On the contrary so highly does he regard the demonstrations of Aristotle whom he calls the philosopher that he opens the *Summa Theo logica* with the question Whether besides th philosophical sciences any further doctrine is required

He answers that it was necessary for the salvation of man that certain truths which ex ceed human reason should be made kno vn to him by divine revelation Even as regards those truths about God which human reason can in vestigate it was necessary that man be taught by a divine revelation For the truth about God such as reason can know it would only be known by a few and that after a long time and with the admixture of many errors whereas man s whole salvation which is in God de pends upon the knowledge of this truth It was therefore necessary that besides the philo sophical sciences investigated by reason there should be a sacred science by way of revela t on That sacred science is theology—not the theology which is a part of ph losophy but the theology whose princ ples come from faith rather than from reason

There is no reason Aquinas writes why those th ngs which are treated by the philosoph ical sciences so far as they can be known by the li ht of natural reason may not also be treated by another science so far as they are known by the light of the divine revelation On this view sacred theology may treat of certa n things such as the mystery of the Trinity which do not belong properly to the philoso pher because they exceed the power of reason to demonstrate but other matters concern ng nature man and God may belong both to the philosopher and to the theologian who con sider them according to their different lights Since a truth cannot conflict with a truth though reason sponsors one and faith the other there can be no conflict between philosophy and theology

SOME MODERN philosophers like Bacon and Locke seem to agree with mediaeval theolo gians about the subordination of philosophy to theology But for the most part the modern tendency increasingly evident in the writings of Descartes Spinoza Kant and Hegel is to in sist upon the complete autonomy of philosophy

Hegel for example challenges the imputa tion against Philosophy of being shy of noticing religious truths or of having occasion to be so and the insinuated suspicion that it has any thing but a clear conscience in the presence of these truths So far from this being the case Hegel remarks the fact is that in recent times Philosophy has been obliged to defend the do main of religion against the attacks of several theological systems

The diverse aspects of the problem of the re lation of philosophy to theology and of the ology to faith are discussed in the chapters on METAPHYSICS THEOLOGY and RELIGION The problem which is more characteristic of the modern consideration of philosophy concerns its relation to science

To state the problem some distinction be tween the two is necessary and making this dis tinction represents a novel departure both in thought and language As we have seen philos ophy and science are almost identified through out the ancient and mediaeval tradition Inso far as the word science means knowledge rather than opinion the result of philosophical inquiry is science and philosophy as a whole is divided into a number of sciences There may be as ancient writings seem to suggest sciences which aim at useful productions rather than at speculative or practical wisdom and fall below the level of philosophy or there may be as some Christian theolog ans hold a sacred science superior in its wisdom to all the philosophical sciences But these exceptions to the identity of philosophy and science merely confi m the point that in the ancient or mediaeval vi v ph losophy is scientific and cons ts of n s even though there may b science which are not ph losoph al

This use of the wo ds science and

ophy persists well into modern times Hobbes for example presents his classification of the types of knowledge under the heading science that is Knowledge of Consequences which is also called Philosophy Bacon proposes to divide sciences into theology and philosophy Descartes uses the words science and philosophy interchangeably Among the different branches of Philosophy he says I had in my younger days to a certain extent studied Logic and in those of Mathematics Geometrical Analysis and Algebra—three arts or sciences which seemed as though they ought to contribute to the design I had in view In the Prefatory Letter to his *Principles of Philosophy* he likens philosophy as a whole to a tree whose roots are metaphysics whose trunk is physics and whose branches which issue from this trunk are all the other sciences These reduce themselves to three principal ones *ie* medicine mechanics and morals

Even as near the end of the eighteenth century as Hume the word philosophy continues to be the general name for the particular sciences It covers the experimental study of natural phenomena as well as what are for Hume the non experimental sciences of mathematics and psychology But it excludes divinity or theology insofar as its best and most solid foundation is *faith* and divine revelation metaphysics which is nothing but sophistry and illusion and all inquiries into particular as opposed to general facts such as history chronology geography and astronomy

Nor is this use of terms confined to what readers today would call books of philosophy The authors of the books which are today regarded as among the foundations of modern science—Galileo Newton Huygens and in the eighteenth century Lavoisier and Fourier—refer to themselves as philosophers and to the science in which they are engaged *e g* mathematics mechanics physics chemistry as parts or aspects of natural philosophy They do however indicate an awareness of how they differ from ancient and mediaeval scientists (who also called themselves philosophers) by calling their own work experimental philosophy

In this phrase lies the root of the distinction between philosophy and science as that distinction is generally understood by writers since the eighteenth century The word experimental applied to philosophy signifies a radical difference in the method of inquiry and even in the objects to be investigated for certain objects can be known only by experimental or empirical research Kant appears to be the first (in the great books at least) to make a sharp separation between the investigation of either nature or mind by what he calls empirical as opposed to rational methods He still uses the name science for both sorts of investigation but he appears to restrict philosophy to the latter—the pure the *a priori* the rational sciences.

Two other innovations must be noted Though Kant regards it as a rational discipline he excludes mathematics entirely from philosophy and criticizes its misleading influence upon those philosophers who have tried to imitate mathematical thought And though he sometimes uses metaphysic narrowly to designate the critical examination of pure reason itself he also says that this name of metaphysic may be given to the whole of pure philosophy excluding all that belongs to the empirical and the mathematical employment of reason Considering that it has only two objects nature and freedom—that which *is* and that which *ought to be*—Kant divides philosophy into the speculative and the practical use of pure reason which gives rise to a *metaphysic of nature* and a *metaphysic of morals* Metaphysic therefore that of nature as well as that of morals and particularly the criticism of our adventurous reason which forms the introduction to and preparation for it constitute together Kant writes, what may be termed philosophy in the true sense of the word Its only goal is wisdom and the path to it science

Kant s innovations in vocabulary plainly announce the separation of philosophy from mathematics and experimental science which is only intimated by earlier modern writers But Kant still uses the word science for both the philosophical and the empirical sciences The final step is taken in the nineteenth century when the word science is restricted to mathematics and to such knowledge of nature man and society as can be obtained by the methods of experimental or empirical research William James, for example stresses the fact that he is trying to expound psychology as one of the natural

sciences and to that end he tries to separate the problems which are capable of empirical in vestigation from those which belong to philo sophical speculation For Freud that separation is an accomplished fact and one which leaves to philosophy no problem that can be solved by science

According to Freud it is inadmissible to declare that science is one field of human in tellectual activity and that religion and philos ophy are others at least as valuable and that science has no business to interfere with the other two On the contrary Freud thinks it is right for scientific research to look on the whole field of human activity as its own and to criticize the unscientific formulations of philosophy The trouble with philosophy is that it behaves itself as if it were a science but it parts company with science in that it clings to the illusion that it can produce a com plete and coherent picture of the universe It is this illusion which science continually punctures sin e in Freud s opinion that pic ture must needs fall to pieces with every new advance in our knowledge.

WHEN SCIENCE AND philosophy are set apart at last it is possible to make sense of the typically modern questions concerning philosophy How does it stand in relation to science? Does it con sist of verifiable knowledge comparable to that which can be obtained in the natural and social sciences? If not what is the standard of truth in philosophy? Does it consist of definitions and postulates leading to rigorously demonstrated conclusions in a manner comparable to mathe matics especially in its modern construction? If not must it not be re arded as opinion or speculation rather than as knowledge in any strict sense? Or if ph losophical thought can be compa ed with mathematics does not the di versity of definitions and postulates employed by different philosophers reduce philosophy to a collection of competing systems rather than a sin le discipline in which philosophers work cooperatively as do scientists and mathema t cians?

How ever the foregoing questions are an swered there are still others Does philosophy have distinct branches divided accord ng to their objects of study like the natural sciences or is philosophy to be identified with metaphys ics? If in addition to metaphysics there is a philosophy of nature how are its principles and conclusions related to the findings of the natural sciences which appear to study the same object? Similarly if psychology is a branch of philoso phy how is it related to experimental or clinical psychology? What is the relation of moral and political philosophy to the empirical social sciences concerned with describing not judging or regulating human conduct and ocial insti tutions? Is economics a science or is it a branch of moral philosophy or if it is both how are the two related?

What is the use of philosophy especially in its theoretic branches if unlike science it can not be applied to the mastery of physical nature and the production of utilities whether bridges or bombs? What finally at the end of its long history does philosophy come to if in such marked contrast to the continuously acceler ated progress of the sciences it cannot claim any signal advance on which all philosophers are agreed but instead must admit that most of its problems seem to be perennially debated now as in every preceding century?

SOME OF THESE questions as well as certain answers to them are considered in other chap ters the comparison of empirical re earch and philosophical thought as constituting different types of science in the chapter on SCIENCE the distinction and relation between natural philos ophy and natural science in the chapter on PHYSICS the difference between philosophical and scientific psychology in the chapter on MAN the function of definitions hypotheses postulates or axioms in the foundat on and method of philosophy and science in the chapter on PRINCIPLE the d fference between the prac t cal use of philosophy in the sphere of morals and the use of science in the sphere of the pro ductive arts in the chapter on KNOWLEDGE the accumulat on of truth as measuring advances in science and philosophy in the chapter on PROG RESS

Here we must observe th t such answers to these questions as tend to subordinate philo o phy to science originate exclusi ely th mod ern views of the nature of knowl dge of the criteria of truth and of the cap c ties of the

phy does not promise eternal salvation or earthly prosperity The uses of philosophy as compared with religion and science must somehow be assessed in the terms which from the beginning of philosophy are of its essence—the love of wisdom and through it the search for human wisdom which shall be at once speculative and practical

Chapter 67 PHYSICS

INTRODUCTION

CONCERNING the subject matter of physics one thing seems to be tradition ally taken for granted The object of its study is the sensible world of changing things or mat ter in motion When Plato for example con ceives astronomy as dealing not with the actual and observable motions of the heavenly bodies but with the possible forms of the motions of solids he gives it the character of a mathemat ical rather than a physical science He asso ciates it with geometry as for a similar reason he associates music—divorced from concern with audible harmonies—with arithmetic In anyone s view if a science does not investigate sensible realities if it does not undertake to ac count for the motions of actual bodies or stated most generally if it has no concern with the phenomena of change then it does not have the character of physical or natural science

The early Greek physicists the pre Socratics to whom Plato and Aristotle refer inaugurate the study of change with speculations about ultimate origins the underlying principles or causes of natural phenomena Sometimes they are called philosophers and sometimes scientists —or at least precursors of empirical science But there seems to be no difference of opinion about their title as physic sts Their undisputed claim to this title derives not from the method they employ but from the object they study—*change* In that primary meaning of the word nature which comes from the Latin *natura*—the equivalent of *phusis* in Greek—they can be called naturalists or physicists indif ferently The realm of nature is the realm of change

It is for this reason that Aristotle consider ing the theories of his predecessors in the open ing chapters of his *Physics* sets Parmenides apart from all the rest Parmenides affirmation of the un ty of being which leads to his denial of the reality of change or motion cannot be treated as a physical theory On the contrary it is according to Aristotle a complete negation of the subject matter of physics No matter what other points physicists may dispute among themselves they must all at least agree in taking a stand against Parmenides Aristotle does not even seem to think that a book on physics is the proper place to argue against Par menides That argument belongs to another part of philosophy The reality of change seems to him sufficiently evident to assure the physicist that he has a subject matter to inves tigate

THE QUESTION whether the early physicists were sc ent sts or philosophers calls attention to different methods of investigating natural phe nomena Agreement on the subject matter of physics may prevail therefore only in very general terms When in a manner to accord with the method employed the object of phys ical inquiry is more specifically defined there seem to be two physics not one—a philosoph ical and a scientific physics a philosophy of na ture and a natural science or to use Kant s phrasing a rational or pure physics and an empirical or experimental physics

Though Newton may call his work a philos ophy of nature he also refers to it as an experi mental philosophy in order to distinguish it from the work of earlier natural philosophers who did not perform experiments The differ ence between the physi s of Newton and that of Aristotle seems however to involve more than a divergence in method The problems which Newton and Aristotle try to solve indi cate a difference in subject m tter as well Nevertheless this diff ence falls w th n what in the most general term mu t be conceived as the domain of phys cs For all their

ences both are physicists though both are not philosophers or scientists in the same sense

There are other sources of variation in the definition of physics The problem of the relation of physics to other disciplines—whether thes are other branches of philosophy or other fields of empirical research—raises issues about the object and scope of physics Aristotle Bacon Descartes and Kant for example do not seem to have a common understanding of the relation of physics to mathematics and metaphysics In consequence they conceive physics itself differently

On the level of empirical research physics is sometimes regarded as just one of the natural sciences and sometimes as the whole group of natural sciences In the latter case it includes such fields as astronomy mechanics optics acoustics thermodynamics magnetism and electricity and sometimes chemistry biology and even psychology are included under the head of physical or natural sciences contrasted in the broadest terms to the social sciences The conception of physics obviously changes when its scope is determined by a boundary line which separates it from chemistry or from biology and psychology or from the study of society

The separation of these other sciences from physics does not necessarily imply a discontinuity in nature or the natural sciences The biologist and the psychologist for example consider the physical bases of life and the physical conditions or correlates of mental phenomena Hybrid sciences like biophysics and psychophysics have developed Even the study of society draws upon physics to the extent that the laws of matter in motion and considerations of space and time must be appealed to for an understanding of the physical foundations of economic and political life

OTHER CHAPTERS DEAL with specific physical sciences e g ASTRONOMY and MECHANICS The latter tries to cover the various branches of mechanics and related fields of study such as dynamics opt cs the theory of heat magnetism and electricity particularly so far as these are represented in the work of Galileo Newton Huygens Gilbert Fourier and Faraday The basic concepts of mechanics and its branches or affiliates are also treated in that chapter Still other chapters deal with fundamental terms representing concepts or problems in the larger domain of physics philosophical or scientific e g CAUSE CHANGE ELEMENT INFINITY MATTER PRINCIPLE QUANTITY SPACE and TIME—not to mention NATURE and WORLD terms which represent in the most comprehensive way the reality studied by the physicist

Our discussion here can therefore be restricted to the problems raised in the great books concerning the conception of physics its subject matter and method its relation to other sciences or other parts of philosophy It will lead to such questions as whether physics is supreme among the sciences studying reality or the nature of things and at the other extreme whether physics is at all possible as a science whether there can be scientific knowled e of bodies in motion or of the whole realm of change and becoming

The problem of the distinction between philosophical and scientific physics would appear to be only a special case of the distinction between philosophy and science in general But it is more than that It is the case which tests the main distinction itself since here both philosopher and scientist claim to be expounding the same subject matter or at least to be dealing with the same general field of phenomena

Mathematics and metaphysics bear on the distinction between philosophy and science in a different way If for example we take experimentation or empirical research to be characteristic of science in distinction from philosophy then mathematics would seem to resemble philosophy rather than science On no understanding of the nature of mathematical knowledge is mathematics ever divided into two kinds which are capable of bein described as empirical and rational The possibility of metaphysical knowledge may be challenged but no one has ever proposed an experimental metaphysics to challenge the metaphysics of the philosophers

But physics seems to permit both an experimental and a philosophical treatment Whether they are to be regarded as in conflict with one another depends on whether they are attacking

the same problems by different methods or whether they represent something like a divi sion of labor In the latter view each would deal accordin, to its method with different problems and tend to supplement rather than to exclude the other Psychology is another subject matter which seems to receive a dual treatment—philosophical and experimental—in the tradition of the great books It raises issues similar to those just mentioned They are considered in the chapter on MAN

As the chapters on PHILOSOPHY and on SCIENCE indicate the discussion of their differ ence from and relation to one another is com plicated by the double use of both terms The word science for example is used for both the philosophical and the experimental sciences throughout the greater part of the tradition Similarly until quite recently the name of philosopher is taken by those who experiment as well as by those who do not

It is impossible therefore to speak without confusion of a scientific and a philosophical physics unless the verbal ambiguities are re solved by some convention such as the under standing that when the context indicates that the words science and philosophy are be ing used as opposites rather than as synonyms then science shall signify the experimental and philosophy the non experimental mode of treatment Beyond this it is necessary to proceed as if the chapters on PHILOSOPHY and SCIENCE formed a background for some of the matters to be discussed here Otherwise the consideration of natural philosophy and natural science would tend to become a general dis cussion of philosophy and science

THE GREAT BOOKS of experimental physics seem to have three characteristics in common First and most naturally they insist upon ex perimentation as either the ind spensable source or the ultimate test of scientific formulations Second they tend to rely upon mathematics as much as upon experiment both for the formu lation of nature s laws and for the demonstra tion of the consequences or corollaries of the primary laws Third though expe iments and observations multiply as science develops they seek to bring all the phenomena of nature un der the smallest number of generalizations which have the utmost simplicity in mathe matical statement

On the second and third points Newton s declarations seem to be most explicit Nature he says is pleased with simplicity and affects not the pomp of superflous causes Accord ingly Ne vton directs his efforts toward the simplest statement of the laws of motion and these he seeks to give the universality requisite for covering every type of natural phenomenon At the opening of the third book of the *Mathematical Principles of Natural Philosophy* he ex plains that in the preceding books he has laid down the principles of philosophy prin ciples not philosophical but mathematical such namely as we may build our reasonings upon in philosophical inquiries These princi ples are the laws and conditions of certain mo tions and powers or forces From these same principles he will now undertake to demon strate the frame of the System of the World

In the Preface to the first edition of this work Newton describes the third book as one in which he derives from the celestial phe nomena the forces of gravity with which bodies tend to the sun and the several planets Then from these forces by other propositions which are also mathematical he goes on I deduce the motions of the planets the comets the moon the sea But he does not consider h s work to have attained the goal of physics—the compre hension of all natural phenomena by a few simple mathematical formulae

His confession of failure may also be read as a prognostication of what an experimental physics based on mathematical principles might some day be able to achieve I wish we could derive the rest of the phenomena of na ture by the same kind of reasoning he writes for I am induced by many reasons to suspect that they may all depend upon certain forces by which the particles of bod es by some causes hitherto unknown are either mutually im pelled towards one another and cohere in regular figures or are repelled and recede from one another Einstein s unified field equations covering both gravitational phenomena on the astronomical scale and the electrical attract ons and epulsions of sub-atom p rt cl s seem to realize or at least closely to approximate the ideal Newton has n m nd

Midway between Newton and Einstein Fourier also bears testimony to the ideal of physics as a science at once simple in its principles and universal in the scope of their application The successors of Newton and Galileo he writes have extended their theories and given them an admirable perfection they have taught us that the most diverse phenomena are subject to a small number of universal laws which are reproduced in all the acts of nature It is recognized that the same principles regulate all the movements of the stars their form the inequalities of their courses the equilibrium and the oscillations of the seas the harmonic vibrations of air and sonorous bodies the transmission of light capillary actions the undulations of fluids in fine the most complex effects of all natural forces Thus has the thought of Newton been confirmed he concludes referring to Newton s praise of geometry whose glory it is that the few mathematical principles it provided for use in physics should have been able to produce so many things

ON THE EXPERIMENTAL SIDE the great works of physical science seem to contain diverse notions of the purposes served by experimentation accompanied by a fairly uniform recognition of the dependence of natural science upon experiment In the field of magnetism for example Gilbert sets aside as unscientific all those authors who have written about amber and jet as attracting chaff but with never a proof from experiments These writers deal only in words Such philosophy bears no fruit The fruitfulness of experiments on the vacuum the equilibrium of fluids and the weight of air leads Pascal to conclude that the secrets of nature remain hidden until the experiments which supply us with knowledge about it can be performed and multiplied

We ought never to search for truth but by the natural road of experiment and observation writes Lavoisier and Faraday describes himself as an experimentalist who feels bound to let experiment guide me into any train of thought which it may justify The science of electricity he finds is in that state in which every part of it requires experimental investigation not merely for the discovery of new effects but ultimately for the more accurate determination of the first principles of action of the most extraordinary and universal power in nature

Methods of experimentation necessarily differ in different fields of physical research. Newton s optical experiments with mirrors and prisms were adapted to the phenomena of light, as Galileo s experiment with the inclined plane Pascal s experiment on the equilibrium of fluids or Faraday s experiments with induction coils were adapted to the phenomena of dynamics hydrostatics and electricity The materials employed the apparatus or instruments devised the factors controlled or isolated from irrelevant circumstances and the units of measurement in which the results are recorded naturally vary with the phenomena under observation Yet one thing is common to the variety of experiments described in the great books of physical science They all involve the construction of an artificial physical system which permits more accurate and refined observation than does nature uncontrolled or untampered with

The student of nature must observe in any case no matter whether he is a philosopher or a scientist To say that philosophical physics is non experimental does not mean for Aristotle that knowledge of nature is possible without observation or induction from experience But the experimentalists insist upon the distinction between the kind of observations which men normally make in the course of everyday experience and the kind which involve the special experience enjoyed only by those who observe and in addition measure the results of specially contrived experiments

This point of distinction seems to be strikingly illustrated by a passage in Galileo s *Two New Sciences* One of the persons in the dialogue Simplicio declares everyday experience to show the propagation of light to be instantaneous He explains that when we see a piece of artillery fired at a great distance the flash reaches our eyes without lapse of time but the sound reaches the ear only after a noticeable interval Sagredo replies that this familiar bit of experience permits him to infer only that sound in reaching our ear travels more slowly than light It does not inform us he says whether the coming of light is instanta

neous or whether althou_h extremely rapid it still occupies time The choice between these alternatives could not be determined by ordinary experience An experiment had to be constructed in order to measure the velocity of light

Recourse to experimentation to find by ob servation and measurement the answers which ordinary experience fails to yield does not ex haust the uses of experiment The great experi mental physicists indicate at least three distinct uses to which experiments can be put in addi tion to a merely exploratory use for the dis covery of new effects

In natural philosophy as in mathematics writes Newton the method of analysis ought ever to precede the method of composition or synthesis In physics the method of analysis consists in making experiments and observa tions and in drawing conclusions from them by induction In contrast the synthetic meth od begins with the principles *assumed* there- from explaining the phenomena and prov ing the explanations

Here experiments perform a probative rather than an inductive function As Huygens ob- serves proof in physics does not have the certi tude of mathematical demonstration but it can have an extremely high degree of probability — very often scarcely less than complete proof' —as a result of the experimental con firmation of a conclusion deduced from the assumed principles This occurs when things which have been demonstrated by the prin ciples that have been assumed correspond per fectly to the phenomena which experiment has brou_ht under observation especially when there are a great number of them A single crucial experiment so perfect in construction that all relevant factors have been controlled makes unnecessary the multiplication of experi ments to establ sh the conclus on

A third use of experiment is illustrated by Galileo when he measures the velocity of a ball rolling down an inclined plane in order to de cide whether a certain mathematical definition of uniformly accelerated motion describes the acceleration which one meets in nature in the case of falling bodies The persons in the dialogue seem to be satisfied with some mathe matical reasoning which shows that the velocity increases with the units of time elapsed rather than with the intervals of space traversed But when Simplicio asks for an experiment to show that the mathematical conclusion has physical reality in the sense of describing observable phenomena Salviati replies that this request is a very reasonable one for this is the custom —and properly so—in those sciences where mathematical demonstrations are applied to natural phenomena and where the principles once established by well chosen experiments become the foundations of the entire super structure Here experiment does not confirm conclusions It establishes principles not by inductive generalization but by comparing actual measurements with mathematical ex pectations

WITHOUT EXPERIMENT but not without induc tions from experience without measurements but not without recourse to observation Aris totle s *Phys cs*—and with it such physical treatises as his works *On the Heavens* and *On Generation and Corruption*—represents a phi losophy of nature In Aristotle s meaning of the term science these treatises expound sciences but they also constitute one part of philosophy to be distinguished from mathematics and from what Aristotle regards as the first or highest part of philosophy *i e* the science of meta physics

Aristotle s tripartite divis on of the theoretic sciences or speculative philosophy into physics mathematics and metaphysics raises a question concerning his numerous biological works and perhaps also his treatise *On the Soul* Are these to be classified as physical sciences or parts of natural ph losophy? The fact that Aristotle distinguishes between the forms and properties of living and non living matter does not seem to affect the answer By h s criteria of phys cal inquiry—namely that it investigates what nei ther ex sts nor can be conceived apart from matter and motion and that it is concerned with every type of change—all these works be long to the domain of physics Accordingly even such apparently psychological stud es as those dealing w th sensation memory dreams justify the t tle under wh h th y have been traditionally grouped—*Parva N tur l a i e* short phys cal treatises

For all these more specialized considerations of natural phenomena the *Physics* seems to serve as a general introduction as well as being in its own right an exposition of the most fundamental science in the sphere of natural philosophy It tries to define change and to state the principles underlying every type of change It tries to classify the types of change separating coming to be and passing away simply (or generation and corruption) from coming to be in a special respect (or change in quality quantity and place) which Aristotle usually calls motion in distinction from becoming or generation It undertakes to analyze the conditions or causes of change or motion to distinguish what happens by chance from what happens of necessity to discriminate between natural and unnatural or violent motions to treat the relation of mover and moved to deal with the continuity and divisibility of motions to consider place and time as conditions or aspects of motion and to ask about the infinity of body and of change and about the eternity of motion or the whole order of becoming the natural world of things in motion

Aristotle s physics thus seems to stand in sharp contrast to the physics of the experimentalists not merely in method but in the questions it tries to answer and in the principles to which it appeals The effort to define change in general and to state the principles and causes operative in every type of change might appear to correspond to the search for formulae of maximum generality to cover all natural phenomena But where Newton and Fourier hope thereby to reduce nature s variety to the simplest terms—a few laws of motion comprehending the whole framework of nature—Aristotle tends on the contrary to insist upon an irreducible variety of types of motion kinds of matter and causes of change

Furthermore the principles to which Aristotle appeals are not mathematical He criticizes the discussion of becoming which takes place in Plato s *Timaeus* on the ground that it tries to substitute mathematical for physical terms in the analysis of change Physical bodies contain surfaces and volumes lines and points he writes and these are the subject matter of mathematics but the mathematician is not concerned with these things as the attributes of physical bodies but only as separated in thought at least from matter and motion There are sciences which represent mixtures of mathematics and physics such as optics and harmonics but the existence of these mixed sciences—the equivalent of what is later called mathematical physics —seems to Aristotle to imply rather than deny the separation of purely physical science from pure mathematics

Where Newton (who can be taken as the exemplary author of a physics which is at once mathematical and experimental) goes to mathematics for the principles of natural philosophy Aristotle seems to think that physics has its own proper principles If any deeper understanding of these principles is sought it is not to be found in mathematics but in metaphysics or what Aristotle calls the first philosophy

For example matter form and privation are proposed by Aristotle as the basic physical principles In such terms he is able to state his insight that all change involves a substratum (or *that which* changes) and contraries (or that *from which* and that *to which* the change occurs) But the analysis of matter and form in terms of potentiality and actuality as modes of being and the consideration of form and privation in terms of being and non being belong to metaphysics rather than physics

Furthermore Aristotle as a physicist deals with bodies in motion and with the difference between the generation of bodies and their alteration increase and decrease or change of place But he leaves to metaphysics—to the books which come after the books on physics—the discussion of physical bodies as substances composite of matter and form and the distinction of substance and accident which bears on the difference between substantial and accidental change (*i e* generation and corruption as opposed to the change in quality quantity or place)

Though for Aristotle physics is as separate from metaphysics as it is from mathematics in subject matter physics depends upon metaphysics as it does not upon mathematics for the establishment as well as the elucidation of its principles It is in this sense that metaphysics is logically prior to physics But there may also be a sense in which philosophical physics is

logically prior to experimental natural science To the extent that the experimentalist employs physical as opposed to mathematical principles he may have to derive these from a philosophy of nature Galileo for example investigates the properties of natural and violent motions in the Third and Fourth Day of his *Two New Sciences* (*i e* the motions of freely falling bodies and of projectiles) The problem of establishing the reality of this distinction and of defining the natural and the non natural types of motion seems to be a matter of philo sophical analysis rather than of experimental investigation

BACON AND KANT appear to agree with Aris totle about the separation of physics from mathematics Rational (or pure as opposed to empirical) physics is according to Kant en tirely separate from mathematics It is not to be confused with what is commonly called *physica generalis* which is mathematics rather than a philosophy of nature Criticizing the natural philosophy of the ancients because it is corrupted by logic in the school of Aristotle and by mathematics in the school of Plato Bacon says that mathematics should terminate natu ral philosophy rather than generate or create it We may hope for better results he adds from pure and unmixed natural philosophy

Bacon elsewhere observes that the investi gation of nature is best conducted when mathe matics are applied to physics He does not deny the great use of mathematics in physics but rather insists that mathematics be regarded as an appendage or auxiliary of natural phi losophy not its master He is writing aga nst the mathematicians who would have their science pres de over physics

But to whatever extent Aristotle Bacon and Kant are in agreement concerning the re lation of physics and mathematics their the or es of the scope and subject matter of physics seem to be at var ance For Bacon phys cs is only one of the theo etic parts of natural phi losophy the other is metaphysics Both are sciences of nature or the physical world though one investigates material and efficient the other formal and final causes Both stud es moreover can be conducted experiment lly and can yield practical fru ts (in me han cs and what Bacon calls magic ') through the pro duction of effects by the application of a knowl edge of causes

For Kant the whole body of theoretical knowledge which is rational and *a priori* not empirical and *a posteriori* is the metaphysic of nature of which one part is rational physics and the other rational psychology The meta physic of corporeal nature he writes is called *physic* or because it must contain the principles of an *a priori* knowledge of nature only *rational physic* Here physics and meta physics do not have distinct objects as they do for Aristotle nor does Kant s conception of physics as purely *a priori* knowledge of nature seem to agree with Aristotle s conception of physics as inductive and empirical if not exper imental

These issues concerning the relation of physics to mathematics and metaphysics have significance for the experimental as well as the philosophical study of nature If for example following the position taken by Hume meta physical inquiry is dismissed as incapable of yielding knowledge and mathematical knowl edge is restricted to the realm of ideal entities then natural science which for Hume consists in experimental reasoning about matters of fact be omes the only knowledge of reality Even though Hume looks upon the conclusions of experimental reasoning as at best probable it remains the case that questions about nature which cannot be answered by physics cannot be answered scientifically

The effect is the same as that achieved by Hobbes who makes physics the primary science of reality on the ground that nothing exists except bod es in motion The assertion of the primacy of physics in short may be due *e ther to the denial that immaterial objects can be* known by us *or* to the den al that such objects have any real existence Of quite opposite tenor is the view that only immaterial and eternal things can be scientifically kno vn and that the sensible world of things which come to be pass away and are forever undergo ng change belongs to the realm of probab l ty and opinion not knowledge

For Plato mathemat es and d alect c n be r spectively sc ence and wisdom bec use they study th ntell g ble real ty of being in its im

mutable forms But the physicists who try to give an account of becoming in all its changing sensible app arances can do no better than adduce probabilities as likely as any others On such matters Timaeus says we ought to accept a tale which is probable and inquire no further After discoursing at length of physical matters Timaeus apologizes for the merely conjectural character of his account of natural phenomena saying that a man may sometimes set aside meditations about eternal things and for recreation turn to consider the truths of becoming which are probable only he will thus gain a pleasure not to be repented of and secure for himself a wise and moderate pastime

This view goes further than Hume s in depreciating physics by contrasting its probability with the certitude of mathematics It praises mathematics and dialectic as Hume s theory does not for something more than their certitude—for their being knowledge of reality rather than of appearances

Furthermore Hume unlike Plato does not think the probability of physics detracts from its utility the sort of utility which Bacon magnifies more eloquently than Hume—the invention of machines and the technical applications of physics whereby man extends his dominion over nature In the traditional discussion of the dignity and value of physics Plato and B co seem to represent attitudes as far apart as are the theories of Aristotle and Newton in the discussion of the subject matter and method of physics

OUTLINE OF TOPICS

PAGE

1 Physics as the general theory of becoming and the order of nature or change philosophical physics the philosophy of nature pure or rational physics 371

1a The relation of the philosophy of nature to metaphysics and dialectic

1b The relation of the philosophy of nature to mathematics mathematical method and mathematical principles in natural philosophy 372

2 Experimental physics and the empirical natural sciences the relation of experimental and philosophical physics

2a The derivation of definitions distinctions and principles from the philosophy of nature the metaphysics of the scientist

2b The treatment of causes in philosophical and empirical phys cs description and explanation theory and prediction 373

3 The role of mathematics in the natural sciences observation and measurement in relation to mathematical formulations

4 The experimental method in the study of nature 374

4a The distinction between simple observation and experimentation the art of creating ideal or isolated physical systems

4b Experimental discovery inductive generalization from experiment the role of theory or hypothesis in experimentation

4c Experimental testing and verification the crucial experiment

4d Experimental measurement the application of mathematical formulae 375

5 The utility of physics the invention of machines the techniques of ngineering the mastery of nature

Chapter 68 PLEASURE AND PAIN

INTRODUCTION

PLEASURE and pain writes Locke like other simple ideas cannot be described nor their names defined the way of knowing them is only by experience That pleasure and pain are elementary experiences attributed to animals as well as enjoyed or suffered by men is attested by poets and physiologists alike by economists and theologians by historians and moralists Yet in the tradition of western thought few of the great writers are content to leave the nature or meaning of pleasure and pain to the intuitions of experience alone

Conflicting definitions are proposed Psychologists disagree about the conditions under which the feelings of pleasure and pain occur their causes and consequences their relation to sensation to desire and emotion to thought vol tion and action Moralists dispute whether pleasure is the only good and pain the only evil whether pleasure is only one good among others to be assessed according to its worth in the scale of goods whether pleasure and pain are morally indifferent whether some pleasures are good others bad or all are intrinsically evil

Not only in the theory of good and evil but also in the theories of beauty and truth pleasure and pain are fundamental terms They are affected by all the difficulties which belong to these great themes and also with the difficulties attendant on the ideas of vi tue sin and punishment of duty and happiness into the consideration of which pleasure and pain traditionally enter

The trad tional use of the words pleasure and pain is complicated by more than the variety of definitions which have been given. Other words are frequently substitut d for them sometimes as synonyms and sometimes to expres only one part or aspect of their meaning Locke for example uses pleasure or delight pain or uneasiness and he observes that whether we call it satisfaction delight pleasure happiness etc on the one side or uneasiness trouble pain torment anguish misery etc on the other they are still but different degrees of the same thing Other writers use joy and sorrow or grief as synonyms for pleasure and pain

The words pleasure and pain are closely associated in meaning with pleasant and unpleasant though Freud sometimes uses unpleasure (*unlust*) to signify an opposite of pleasure which is not the same as ordinary pain (*schmerz*) The pleasant is often called agreeable enjoyable or satisfying In the language of Shakespeare the words like and dislike have currency as the equivalents of please and d splease A person who is d s pleased by something says of it that it likes me not

THE PROBLEM OF what pleasure and pain are seems logically to precede the ethical consideration of their relation to good and evil happiness and misery virtue and duty But in the tradition of the great books the psychological questions about pleasure and pain are usually raised in moral or political treatises and sometimes in connection with discu sions of rhetoric What pleasure is how it is caused and the effects it produces are seldom considered apart from hether pleasures should be sought or avoided whether some pleasures should be preferred to others and whether pleasure is the sole criterion of the good Sometime as w th Marcus Aurelius and Epictetus the ethical point—that pleasure and pain are in one sense morally indifferent—is made without any psychological account of the nature nd orig n of these experiences. More frequ ntly as in Plato s *Ph leb us* and Aristotl s *Ethics* or in

writings of Hobbes Spinoza Locke and Mill the psychological discussion is imbedded in an ethical or political context

Even Lucretius and William James do not seem to be complete exceptions James theory that the feeling of pleasure accompanies activity which is unimpeded whereas pain attends arrested activity seems to be a purely psychological observation and one which can be readily divorced from moral considerations on the ground that it makes no difference to the occurrence of pleasure and pain whether the activity in question is ethically good or bad Yet James makes this observation the basis for arguing against those whom he calls the pleasure philosophers —those who make pleasure the only motive or goal of conduct They confuse he thinks the pursuit of pleasure itself with the pleasure which accompanies the successful a hievement of other things which may be the goals of activity

A *pleasant act* he writes and an act *pursuing a pleasure* are in themselves two perfectly distinct conceptions though they coalesce in one concrete phenomenon whenever a pleasure is deliberately pursued Because a plea ure of achievement *can* become a pursued pleasure upon occasion it does not follow that everywhere and always that pleasure must be pursued One might as well suppose that because no steamer can go to sea without incidentally consuming coal and because some steamers may occasionally go to sea to *try* their coal that therefore no steamer *can* go to sea for any other motive than that of coal consumption

Psychological observations of this sort have an obvious relevance to Aristotle s theory of good and bad pleasures as well as to Locke s and Mill s position that pleasure is the only good or the only object of desire They reveal an ethical strain even in the psychologist view of pleasure and pain The same point can be made with regard to James observation that pleasures are generally associated with beneficial pains with detrimental experiences

Lucretius appears to give a purely physiological account of pleasure and pain in terms of the effect upon the sense organs of various atomic configurations Those things wh ch can touch the senses pleasantly are made of smooth and round bodies but those which seem to be bitter and harsh are made up of particles more hooked and for this reason are wont to tear a way into our senses Hot fires and cold frost have particles fanged in different ways to prick the senses But Lucretius is concerned to point out not only the basis of pain in the atomic nature of things but also the natural tendency of all sensible things to avoid pain as the one besetting evil Nature cries aloud for nothing else but that pain may be kept far sundered from the body and that withdrawn from care and fear she may enjoy in mind the sense of pleasure

Without giving any psychological explanation of the pleasures of the mind Lucretius sets them above the pleasures of the body because the latter—as his diatribe against love makes clear—seem to be inevitably followed by bodily torments or even to be admixed with them The first maxim of nature then is not to seek pleasure but to avoid pain and among pleasures to seek only the unmixed or pure the pleasures of knowledge and truth The distinction between different qualities of pleasure (pleasures of the body and of the mind mixed and pure pleasures) which is made by Plato and Mill as well as by Lucretius inevitably tends to have at once both moral and psycholo ical si nifican e

If in the great books there is any purely psychological theory of pleasure and pain divorced from moral considerations it is probably to be found in Freud The pleasure principle according to him automatically re ulates the operation of the mental apparatus Our entire psychical activity he writes is bent upon *procuring pleasure* and *avoidin pain* Though pleasure and pain are for him primary elements of mental life Freud admits the difficulty they present for psychological analys s We should like to know he writes hat are the conditions giving rise to plea ure and pain but that is just where we fall short We may only venture to say that pleasure is *in some way* connected with lessening lowerin or extinguishing the amount of stimulation in the mental apparatus and that pain involves a heightening of the latter Consideration of the most intense pleasure of which man is capable the pleasure in the performance of the sexual act leaves little doubt upon this point

Yet for Freud the pleasure principle is not the only regulator of mental life In addition to the sexual instincts which aim at gratification and pleasure there are the ego instincts which under the influence of necessity their mistress soon learn to replace the pleasure principle by a modification of it The task of avoiding pain becomes for them almost equal in importance to that of gaining pleasure the ego learns that it must inevitably go without immediate satisfaction postpone gratification learn to endure a degree of pain and altogether renounce certain sources of pleasure Thus trained the ego becomes reasonable is no longer controlled by the pleasure principle but follows the reality principle which at bottom also seeks pleasure—although a delayed and diminished pleasure one which is assured by its realization of fact its relation to reality

This recognition of a conflict between pleasure and reality with a consequent attenuation or redirection of the pleasure principle is not amplified by Freud into a moral doctrine It does however bear a striking resemblance to the theories of moralists like Kant who oppose duty to pleasure and also to the teachings of those ho like Aristotle and Aquinas conceive virtue as the foregoing of certain pleasures and the endurance of certain pains th ough a reasonable and habitual moderation of these passions

IF PLEASURE AND pain were simply sensations like sensations of color or sound they would pose a problem for the physiological psychologist no different from the problems which arise in the fields of vision and audition Modern physiological research claims to have discovered differentiated nerve endings for pain which together with the specific sense-organs for pressure heat and cold make up the cutaneous senses But whether there are spec al cells for the reception of pain stimuli or whether cutaneous pain results from the too intense stimulation of the pressure and thermal nerve endings there seems to be no evidence of organs sensitized to pleasure as for example the n rve cells of the retina are sensitized to light The feeling of pleasure it would seem to follow is not a sensation This seems to be confirmed by the traditional observat on that every type of sensation including the sensation of pain can be pleasant

Even if pain unlike pleasure is found to be a specific mode of sensation with a special sense organ of its own all other types of sensation—visual auditory olfactory etc —might still have painfulness or a feeling of unpleasantness as an attribute That such is the case seems to be a matter of traditional observation Locke for example says that delight or uneasiness one or the other of them join themselves to almost all our ideas of sensation and reflection there is scarce any affection of our senses from without which is not able to produce in us pleasure or pain So understood pleasure and pain —or the pleasant and the unpleasant—are not opposite sensations as are hot and cold but contrary attributes with which every sort of sensation *can* be affected All *need* not be Some sensations may be neutral with respect to what psychologists call affective tone or affective quality

The kind of pleasure and pain which is called bodily or sensuous would thus be sensuous because it is an attribute of sensations and bodily because sensations involve bod ly organs But in almost every great discussion of pleasure and pain other types are recognized intellectual delights the pleasures and pains of learning aesthetic pleasure in contemplating beauty with the mind as well as with the senses and the pain of loss the grief accompanying deprivation which is so different from the torment of a painful affliction of the senses The human suffering with which the great poems deal is much more often a torment of the spirit than *of the flesh*

To cover these other types of pleasure and pain we must go beyond sensation to two other terms traditionally connected with the psychological analysis of pleasure and pain One is emotion the other desire the latter to be understood broadly as including both the sensitive and the rational appetites—both the passions and the will Aquinas for example treats joy and sorrow as specific emotions which represent the appetite in a state of satisfact on or frustration So too the will as an appetite can come to rest in the attainm nt of ts object and with fruit on be in a state of joy

As conditions of the appetite

pain (or joy and sorrow) can be either passions and like all other emotions bodily states or th y can be acts of the will and according to Aquinas at least spiritual states But either way pleasure and pain seem to repre ent the satisfaction or frustration of desire rather than objects desired or averted To be pleased by the attainment of an object desired such as food and drink or knowledge is not the same as to desire pleasure itself as for example the pleasant sensations which may be involved in eating or drinking

Aquinas talks about the desire for pleasure and the aversion to pain as well as the pleasure and pain of satisfied and unsatisfied desires Since the same words are almost always used to express both meanings the two senses of pleasure and displeasure may go unnoticed unless by context or by explicit mention the author refers to pleasure as an object of desire or identifies it with the satisfaction of any desire whether for pleasure or for some other object As a passage already quoted from James indicates and as we shall presently see more fully the distinction betwe n these two senses of pleasure his a critical bearing on the dispute between those who think that pleasure is the only good and those who think that pleasure is one good among others

The generally recognized difference between two kinds of pain—the pain of sense and the pain of loss or deprivation—parallels the distinction which most writers acknowledge between sensuous pleasure and the pleasure of possession or satisfaction Plato s example of the pleasure involved in the relief of itching by scratching seems to catch both meanings and in addition to show that bodily pleasures may be either sensual *objects* or sensual *satisfactions* In contrast the pleasures of the mind are satisfactions of intellectual desire as in the contemplation of beauty or the knowledge of truth

Aristotle deals with pleasure and pain as *objects* when he defines temperance as a moderate pursuit of bodily pleasures and courage as controlling the fear of pain and its avoidance. But he also conceives pleasure as that which completes any activity whether of the senses and the body or of thought and the mind Without activity he writes pleasure does not arise and every activity is completed by the attendant pleasure This meaning of pleasure seems to be analogous to if not identical with pleasure as satisfaction at least insofar as the satisfaction of a desire is that which completes the activity springing therefrom There can be as many different kinds of pleasure as there are kinds of activity the quality of the pleasure is determined by the character of the activity it accompanies

Though Mill refers to pleasure and freedom from pain as the only things desirable as ends he admits many other objects of desire in the attainment of which men find pleasure or satisfaction It is wrong to suppose that human beings he writes are capable of no pleasures except those of which swine are capable Precisely because human beings have faculties more elevated than the animal appetites they have sources of pleasure or gratification not open to swine Here as before two meanings of pleasure seem to be involved In pointing out that money in many cases is desired in and for itself Mill is naming an object of de ire which like health knowledge power or fame is not pleasure yet which through being desired is a source of pleasure (*i e* satisfaction) when achieved Like other objects of desire sensual or bodily pleasures may also be sources of satisfaction

These two meanings of pleasure are most in need of clear distinction when the relation of pleasure to happiness is being discussed If happiness as Aristotle and Mill seem to say consists in having all desires satisfied then the content of the happy life can be described either in terms of the goods which the happy man possesses—the objects of desires fulfilled—or in terms of the pleasures which accompany the goods possessed that is the pleasures which are satisfactions of desire If pleasure in the other meaning especially sensual or bodily pleasure is only one object of normal desire then lack or deficiency of pleasure may like loss of health or fortune impair a man s happiness But the pursuit of pleasure in this sense cannot be identified with the pursuit of happiness A life including every sort of bodily pleasure and free from every sort of bodily pain if it lacked other things men normally desire would be marred by many dissatisfactions inconsistent with happiness.

Talking to Don Quixote of the island he would like to govern Sancho Panza says The first thing I would do in my government I would have nobody to control me I would be absolute Now he that s absolute can do what he likes he that can do what he likes can take his pleasure he that can take his pleasure can be content and he that can be content has no more to desire Here it would seem San cho conceives happiness as the sum of pleasures in the sense of satisfactions—all desires come to rest through the possession of their objects

Dr Johnson seems to make the opposite point about pleasure and happiness Boswell asks him whether abstention from wine would be a great deduction from life It is a dimi nution of pleasure to be sure Johnson replies but I do not say a diminution of happiness But Boswell asks if we could have pleasure always should we not be happy? Johnson ex plains his negative answer by saying that when we talk of pleasure we mean sensual pleasure When a man says he had pleasure with a wom an he does not mean conversation but some thing of a different nature Philosophers tell you that pleasure is contrary to happiness

This last observation does not seem to de scribe the position taken by those philosophers who make happiness the greatest good or ulti mate end of human striving Both Aristotle and Mill distinguish the life of pleasure the bestial or swinish life from one which employs the hi her faculties peculiar to man In this sense perhaps the life of pleasure can be regarded as contrary or opposed to what Johnson along with Aristotle and Mill calls the rational life But pleasure itself far from being inim cal to happiness either represents the state of satis faction which is identical with happiness or one of the *things a man desires and hence a* constituent of the happy life

Hobbes and Locke seem to go further in the direction of identify ng pleasu e with happiness or the good Pleasure writes Hobbes is the appearance or sense of Good and Displeas ure the appearance or sense of Ev l Simi larly Locke says that things are good or evil only in reference to pleasure or pain That we call *good* which s apt to cause or ncrease pleas ure or to diminish pain in us And on the contrary we name that *ev l* which is apt to pro duce or increase any pain or diminish any pleasure in us As for happiness it is accord ing to Locke the utmost pleasure we are ca pable of and misery the utmost pain and the lowest degree of what can be called happiness is so much ease from all pain and so much present pleasure as without which anyone can not be content

In which sense of the term is Locke identi fying pleasure with happiness? Not sensual pleasure nor even pleasure as an object of de sire it would seem for he says Let one man place his satisfaction in sensual pleasure an other in the delight of knowledge though each of them cannot but confess there is great pleas ure in what the other pursues yet neither of them making the other s delight a part of *his* happiness their desires are not moved but each is satisfied without what the other en joys Yet his understanding of happiness as consisting in the pleasures or satisfactions ac companying the possession of things desired leads him to criticize [t] the philosophers of old who did in vain inquire whether the *summum bonum consisted in riches or bodily delights* or virtue or contemplation they might have as reasonably disputed whether the best relish were to be found in apples plums or nuts and have divided themselves into sects upon it For as pleasant tastes depend not on the things themselves but on their agreeableness to this or that particular palate wherein there is great variety so the greatest happiness consists in the having those things which produce the greatest pleasure These to different men are very different things

The difference between Locke s position and that of Mill seems therefore not to lie in a different conception of the relation of plea ure *—as object or as satisfaction of des re—to hap* piness but rather in Locke s conception of de grees of happiness as being determined only by larger and smaller quantities of pleasure where as Mill insists *upon diverse qualities of pleasure* and upon the possibility of ordering pleasures as higher and lower In consequence Mill can say what Locke would seem unable to app ove namely that it s better to be a human being d ssatisfied than a pig satisfied b tt r to be Socrates dissatisfied than a fool sat sfied

Locke s denial that happiness is the same

for all men explicitly takes issue with Aristotle s contrary view It also involves an issue about pleasure For Locke as apparently for Hobbes and Mill the good and the pleasant are inseparable Nothing which satisfies a desire can be evil Whether as in Locke s view one satisfaction is as good as another and the only thing which matters is the amount or number of satisfactions or whether as in Mill s view one pleasure may be better than another in no case is a pleasure bad so long as some one desires it or desires the thing which produces satisfaction when possessed

But for Aristotle desires themselves can be good or bad and consequently there can be good and bad pleasures as well as pleasures which vary in quality and in degree of goodness Since activities differ in respect of goodness and badness and some are worthy to be chosen others to be avoided and others neutral so too Aristotle writes are the pleasures for to each activity there is a proper pleasure The pleasure proper to a worthy activity is good and that proper to an unworthy activity bad just as the appetites for noble objects are laudable those for base objects culpable

Pleasure and pain in Aristotle s judgment are measured by virtue not what is good and evil by pleasure and pain Pleasure and pain are elements common to the good life and the bad but only the pleasures which the good man enjoys and the pains he willingly suffers can be called good That is why in educating the young we steer them by the rudders of pleasure and pain for to enjoy the things we ought and to hate the things we ought has the greatest bearing on virtue or character Virtue is possessed only by those who habitually take pleasure in the right things

As INDICATED IN THE chapters on HAPPINESS and DUTY the moralists who make duty rather than virtue the spring of right conduct and who make the goodness of anything depend upon its rightness according to the moral law see little difference among the various theories of pleasure and happiness as the ultimate good and the standard of conduct

The most eloquent tribute which Kant can pay to the idea of duty is that it embraces nothing charming or insinuating Reason he says will never let itself be brought around to the view that there is any intrinsic worth in the real existence of a man who merely lives for enjoyment even when in so doing he serves others Admitting that the greatest a re gate of the pleasures of life taking duration as well as number into account would appear to merit the name of a true nay even of the highest good Kant adds that reason sets its face against this too The line of duty is always set against the seductions of pleasure or any calculations of utility whether in terms of the means to achieving happiness or the ways of augmenting life s satisfactions

According to Stoics like Marcus Aurelius pleasure is neither good nor useful nor is pain an evil for when we are pained by any external thing we should remember that it is not this thing which disturbs us but our own judgment about it Pleasure and pain are morally indifferent for like death and life honor and dishonor pain and pleasure are things which happen equally to good men a d bad and therefore make us neither better nor worse and are neither good nor evil

From the same observation that pleasure is enjoyed by good and bad men Aristotle and Plato seem to draw the conclusion not that it is morally indifferent but as we have seen that there are good and bad pleasures Plato uses pleasure and wisdom to typify fundamentally different kinds of good Wisdom is always true and good but like opinion which can be either true or false there are true and false pleasures, good and evil pleasures Furthermore wisdom or knowledge represents the kind of good which is definite or intrinsically measured whereas pleasure like wealth is an indefinite good requiring something external to itself something like wisdom to measure it and lim t its quantity

If wisdom be allowed to choose among pleasures Socrates suggests in the *Philebus* it will choose those associated with itself in the activities of the mind not the bodily pleasures which are always mixed with pain So far as pleasure belongs to the realm of change or becoming it is again like opinion inferior to knowledge and wisdom which draw their good n ss from the realm of immutable being Ye Plato does not seem to think that knowledge

and wisdom are the only goods The argument against those who think so seems to be as con clusive as against those who think that pleasure is the only good

Each of the simple lives—the life of pleasure or the life of wisdom—is deficient Only the mixed life the life which combines both pleas ure and wisdom is the complete life Like the happy life in Aristotle s view it includes every kind of good and the difficult problem for Plato as for Aristotle seems to be finding the principle which determines the goodness of the mixture or the right order and proportion in which the variety of goods should be combined

THE MORAL ISSUES which have been raised here with respect to pleasure and pain are more broadly considered in the chapters on GOOD AND EVIL and on VIRTUE TEMPERANCE and SIN as well as in the chapters on HAPPINESS and DUTY Other issues are reserved entirely for discussion elsewhere such as the role of pleasure in the perception of beauty and in judgments of taste (the chapter on BEAUTY) or the role of pain in relation to the govern ment of men (the chapter on PUNISHMENT)

Two special problems which involve pleasure and pain remain to be br efly mentioned The first concerns the contrast between asceticism and self indulgence or even profl gacy

In the tradition of western thought and cul ture and in the ancient as well as in the mod ern world those who worship pleasure though perhaps only as a minor deity to be celebrated in bacchic revels stand opposed to those who turn away from pleasure as from the world the flesh and the devil even mortifying the flesh and sanctifying themselves with pain In their less ext eme forms these contrasting atti tudes generate the traditional issue concerning the place of worldly recreations in man s life and in the state Is the pleasure of play a neces sary and proper relief f om the pain of work or is it always an indulgence which provides occa sions for sin? Are the enjoyment of the theatre of music and poetry the gaiety of public festi vals and the d versions of games or sports things to be promoted or prohibited by the state?

Man s avidity for amusements and di ersions of all sorts leads Pascal to say Ho v hollow and full of ribaldry is the heart of man! The fact that men spend their time in following a ball or a hare and that it is the pleasure even of kings indicates to him how deep is the misery from which men try to escape through play and pleasure If man were happy Pascal sug gests he would be the more so the less he was diverted But so wretched is man that he would weary even without any cause of weari ness from the peculiar state of his disposition and so frivolous is he that though full of a thousand reasons for weariness the least thing such as playing billiards or hitting a ball is suf ficient to amuse him Men need such diver sions in order to prevent them from thinking of themselves

Men indulge in pastimes for another reason according to Aristotle They need relaxation because they cannot work continuously and amusement is a sort of relaxation But hap piness does not lie in amusement It would in deed be strange he says if the end were amusement and one were to take trouble and suffer hardship all one s life in order to amuse one s self It is true that pleasant amuse ments resemble happiness in having the na ture of an end because we engage in playful activity not for the sake of other things whereas we do serious work for some end be yond itself But in Aristotle s opinion a vir tuous life requires exertion and since the hap py life is thought to be virtuous it follows that serious things are better than laughable things and those connected with amusement

These reflections on work and play and the pains and pleasures they involve lead us to the second of the two problems mentioned above That concerns pleasure and pain in the life of learning Here there seems to be no funda mental issue for the tradition speaks with an almost unanimous voice of the pleasure all men find in knowing and the pain none can avoid in the process of seeking the truth The prob-lem is rather a practical and personal one which the great books put to their readers to solve in the r individual lives Their invitation to learn ing should not be accepted nor their promise of pleasure relied upon by those unw ll ng to take the pains wh ch ho v ve g t initially gr dually diminish as the mind in the very p c of learning learns how to learn

OUTLINE OF TOPICS

1 The nature of pleasure and pain

2 The causes of pleasure and pain

3 The effects or concomitants of pleasure and pain

4 The kinds of pleasure and pain different qualities of pleasure

4a The pleasant and unpleasant in the sphere of emotion joy and sorrow delight and grief

4b Sensuous pleasure the affective quality of sensations

4c Intellectual pleasure the pleasures of reflection and contemplation

(1) Pleasure in the beauty of nature or art disinterested pleasure

(2) The pleasure and pain of learning and knowledge

4d The pleasures of play and diversion

4e The kinds of pain the pain of sense and the pain of loss or deprivation

5 The quantity of pleasure the weighing of pleasures the limits of pleasure

6 Pleasure and the good

6a Pleasure as the only good or as the measure of goodness in all other things

6b Pleasure as one good among many pleasure as one object of desire

6c Good and bad pleasures higher and lower pleasures

6d Pleasure as the accompaniment of goods possessed the satisfaction of desire

6e Pleasure as intrinsically evil or morally indifferent

7 Pleasure and happiness their distinction and relation

7a Pleasure and pain in relation to love and friendship

7b The life of pleasure contrasted with other modes of life the ascetic life

8 The discipline of pleasure

8a Pleasure and pain in relation to virtue the restraints of temperance and the endurance of courage

8b The conflict between pleasure and duty or the obligations of justice the pleasure principle and the reality principle

8c Perversions or degradations in the sphere of pleasure and pain sadism and masochism

9 The regulation of pleasures by law

10 The social utility of pleasure and pain

10a The employment of pleasure and pain by parent or teacher in moral and mental training

10b The use of pleasure and pain by orator or statesman in persuasion and government

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to For example in **4** HOMER *Iliad* BK II [265 283] **12d** the number **4** is the number of the volume in the set the number **12d** indicates that the passage is in section d of page 12

PAGE SECTIONS When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in **53** JAMES *Psychology* **116a 119b** the passage begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page For example in **7** PLATO *Symposium* **163b 164c** the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

AUTHOR S DIVISIONS One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases *e g* *Iliad* BK I [265 283] **12d**

BIBLE REFERENCES The references are to book chapter and verse When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a *(D)* follows *e g* OLD TESTAMENT *Nehemiah* 7 45—*(D) II Esdras* 7 46

SYMBOLS The abbreviation esp calls the reader s attention to one or more especially relevant parts of a whole reference passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited

Chapter 69 POETRY

INTRODUCTION

THE spirit in which the great poets have read their predecessors differs remarkably from the attitude toward the past which prevails in other fields The philosophers and scientists frequently feel assured that they can improve upon their predecessors The poets for the most part wish only to do as well Virgil s admiration for Homer Dante s accolade to Virgil Milton s praise of Aeschylus Sophocles and Euripides as the three tragic poets unequalled yet by any the tributes which Cervantes and Fielding pay to the poets of antiquity—these testify that there is no battle between the modern and the ancient books of poetry

Contemporary novelists and dramatists—especially those who are proud of their innovations in the forms or materials of poetry—may constitute an exception But they would still be the exception to a rule which can be verified for almost all the great books of poetry Part of the reason for such unusual accord may be that in the tradition of the great books one book enjoys the unique distinction of having founded the science of poetry More than that it seems to have gained from the poets a large measure of approval and even adherence to its principles during a period of more than 2000 years

Not that Aristotle s *Poetics* is without sources They exist in Plato s comments on the kinds of poetry in Aristophanes critical weighing of Aeschylus and Euripides and of course in the original inventions of Homer and the great dramatic poets both tragic and comic Not that the acceptance of Aristotle s theory of poetry is unaccompanied by some dissent as for example in Fielding s quarrel with the rules about the unities of time and place But Fielding like Cervantes who is another close student of the *Poetics* more frequently adopts than rejects Aristotle s basic insights His most rebellious protest—that the originality of creative genius cannot be bound by the laws of art or held accountable to any established critical standards—would certainly receive sympathetic consideration from the man who formulated the rules of poetry and its measures of excellence by the study of the productions of Greek genius

One way in which later poets have expressed their disagreement with the *Poetics* confirms Fielding s insight Those who have violated its rules and yet produced great poems have been men of exceptional genius Where the genius has been lacking to create new forms the violation of the rules has usually resulted in formlessness But it is not only in the creative work of the poets that Aristotle s principles have been put to use and tested His influence also appears in the comments which the poets make on the nature and purpose of poetry The terms and distinctions of the *Poetics* are reflected in the writings of Dante Chaucer Shakespeare Milton Goethe and Melville as well as in many essays in criticism from Horace and Demetrius to Boccaccio Boileau Dryden and Pope

Socrates once complained of the wisdom of the poets Those whom he asked about their poetry were tongue tied They finally resorted to the mystery of inspiration or the inscrutability of genius There is hardly a person present he tells his judges in the *Apology* who would not have talked better about their poetry than they did themselves The poets of a later age were through benefit of Aristotle better able to discourse analytically of their art

IF WE TURN FROM the poets themselves or rather from their poems to the analysis of poetry—by poets or others—we find a number of major issues On what poetry is and on the end it serves the tradition does not seem to be either unified or harmonious Basic disagreements begin with the ancients

On the question for example whether the poets have the same obligation to speak the truth—and the same kind of truth—as do philosophers or scientists Plato and Aristotle seem to be opposed On the question whether the art of poetry lies in its use of language or is primarily the craft of fiction Aristotle s *Poetics* and Horace s *Art of Poetry* represent the op posite answers which have been points of departure for divergent discussions of poetry throughout the whole tradition of western thought

With regard to the second of these two ques tions it may be wondered whether we are in the presence of the sort of disagreement which requires us to take one side rather than the other The fact that Aristotle in his *Rhetoric* writes about poetry in a vein contrary to the theory he advances in his *Poetics* would suggest the possibility of different but not inconsistent points of view about poetry Unless Aristotle unwittingly contradicts himself the rhetorical consideration of poetry is simply a different way of conceiving what is poetic

In the *Adv ncement of Learning* Bacon re cords this difference in the meaning of poetry which had become traditional by his time He treats it moreover as the sort of difference which does not require the rejection of either alternative as incorrect Poetry he writes can be taken in two senses in respect of words or matter In the first sense it is but a character of style and belongeth to the arts of speech and is not pertinent for the present In the latter it is (as hath been said) one of the principal por tions of learning and is nothing else but feigned history which may be styled as well in prose as in verse.

When Bacon says that the conception of poetry as a literary style—as an art of writing in verse rather than prose— is not pertinent for the present he does not reject that al ternative entirely He merely postpones it for the later section of his work in which he treats of grammar and rhetoric. The other alternative —poetry as feigned history —is germane to his present consideration of the kind of learn ing Just as Aristotle does not set his *Rhetoric* against his *Poetics* on the nature of poetry so Bacon does not exclude one of these concep tions in favor of the other when he observes how different are the principles and considera tions appropriate to each

These two points of view about the nature of poetry are not always treated in this way Sometimes one or the other is taken as the primary or even the only way of approaching the subject and then a genuine issue ensues—either with those who take the excluded point of view or with those who find it possible to em brace both The Alexandrian and Roman critics seem to create such an issue by considering poetry largely in terms of style Modern criti cism especially since the beginning of the 19th century goes even further in the direction of identifying poetry with verse

When Wordsworth discusses the art of poet ry in his preface to *Lyrical Ballads* he is con cerned largely with its language His definition of poetry as emotion recollected in tranquili ty indicates his emphasis upon the lyrical as pect of even narrative poetry When Edgar Allen Poe writes his *Poetic Principle* and Mat thew Arnold his *Essays in Criticism* each is con cerned almost exclusively with lyric poetry with that kind of poetry which is written in verse rather than prose The poet tends to be-come more and more a composer of verses—so much so that the free-verse movement can ap pear to be a great revolution in poetry In the *Brothers Karama ov* Smerdyakov says Poetry is rubbish At Maria s protest that she is very fond of poetry he adds So far as it s poetry it s essentially rubbish Consider yourself who-ever talks in rhyme?

Just as the word art has come in popular usage to mean only painting and sculpture so its sister word poetry has also narrowed in significance Contemporary readers who are ac customed to think of poems a lyrics and of poetry as verse may be surprised to learn that according to the significance of its Greek root the word poetry can cover all the forms of art or human productivity they are just as likely to be surprised by the reference to novels and plays written in prose as poems Yet in the tradition of the great books novel sts like Cervantes Fielding and Melville call them selves poets The great books cons d r poetry primarily as narrative rather than lyrical as story rather than song

This does not mean that they e clude the

other consideration of poetry Fielding for example says in one place that poetry demands numbers or something like numbers (i e metre) but for the most part he insists that the art of the novelist or romancer lies mainly in the invention of good stories not in the mastery of rules of prosody which apply only to poems of the lyric sort written in verse Speaking of the sweet influence which melody and rhythm by nature have Plato may observe what a poor appearance the tales of the poets make when stripped of the colors which music puts upon them and recited in simple prose but for Plato as for Aristotle the poet is a teller of tales either in prose or in verse

Aristotle does not ignore the devices of language In the third book of the *Rhetoric* where he considers problems of style in all sorts of compositions he distinguishes poetic from prosaic writing and in the *Poetics* also he devotes a few chapters to style But when in the latter case he deals with the language of poetry he is not concerned with the style of any sort of composition but only of dramatic and epic narratives Except for a brief mention of the form of verse known as the dithyramb Aristotle does not discuss the isolated lyric as a kind of poetry He treats song and spectacle merely as embellishments of the drama In the *Poetics* his emphasis is not upon the devices of language or the sentiments of the poet but upon the construction of plot the development of character the diction and thought of the characters—in short upon the subject matter of the poem rather than upon the feelings of the poet and the eloquence with which he expresses them

Because he regards plot as the soul of tragedy —and by extension the primary principle of all narrative poetry— Aristotle insists that the poet or maker should be the maker of plots rather than of verses He is therefore led to criticize the confusion—apparently prevalent in his day as in ours—which he thinks results from identifying the art of poetry with skill in writing verse Even when a treatise on medicine or natural science is brought out in verse he writes the name of poet is given by custom to the author and yet Homer and Empedocles have nothing in common except the metre so that it would be better to call the one poet the other physicist rather than poet

Just as Bacon later remarks that a true narrative may be delivered in verse and a feigned one in prose so Aristotle says that the poet and the historian differ not by writing in verse or in prose The work of Herodotus might be put into verse and it would still be a species of history with metre no less than without it

That the difference between prose and verse may affect the style of writing but not the essence of storytelling is a point which has wide acceptance among writers who call themselves poets In the Prologue to Melibeus Chaucer's host commands him to leave off rhymin and tell a tale in prose—you might do worse—wherein there's mirth or doctrine good and plain Thinking of his *History of Don Quixote* as a species of epic poetry Cervantes declares that epics may be as well written in prose as in verse

The use by Cervantes and Fieldin of the word history in the title of their novels indicates the acceptance of the other point in the conception of poetry by reference to its subject matter rather than to its linguistic style The great poets recognize that as narrative their works resemble histories but they also know that the stories poets tell are in the words of Bacon imaginary history Just as Fielding writes at length in mock justification of himself as an historian so Melville touches upon the plain facts historical and otherwise of whale fishery lest someone scout at Moby Dick as a monstrous fable or still worse and more detestable a hideous and intolerable allegory In his chapter on the Leviathan's tail he says Other poets have warbled the praise of the soft eye of the antelope and the lovely plumage of the bird that never alights less celestial I celebrate a tail

The conception of poetry as feigned or imaginary history seems to have a direct bearing on the question of the poet's obligation to speak the truth We shall return subsequently to other aspects of the comparison of poetry with history and philosophy For the present we are concerned with the issue in the theory of poetry which arises from applying the standards of knowledge to the inventions of the poet

Bacon like Aristotle denies that such standards are applicable Though he treats poetry as

a part of learning he holds that it is only re strained in measure of words in all other points it is extremely licensed and doth truly refer to the imagination which being not tied to the laws of matter may at pleasure join that which nature hath severed and sever that which nature hath joined Kant on the other hand like Plato judges poetry in terms of its contribution to knowledge A thing of the imagination poetry he maintains serves the understanding for it conducts a free play of the imagination as if it were a serious business of the understanding

Though the *poet* promises merely an enter taining *play* with ideas Kant continues yet for the understand ng there enures as much as if the promotion of its business had been his one intention He achieves a certain combination and harmony of the two faculties of cognition sensibility and understanding which though doubtless indispensable to one another do not readily permit of being united without com pulsion and reciprocal abatement In so doing the poet in Kant s opinion accomplishes something worthy of being made a serious busi ness namely the using of play to provide food for the understanding and the giving of life to its concepts by means of the imagination

Yet Kant and Plato do not agree in their judgment of the poet Regarding the poet s promise as a modest one — a mere play with ideas is all he holds out to us —Kant praises him for achieving more in actual performance than he promises Plato on the contrary seems to think the poet promises more and achieves less He seems to regard the poet not as assisting but as competing with the philosopher The reason why the poet must fail in this attempt is that he tries to do on the level of the imag na tion what the philosopher is better able to do on the level of reason

Both are engaged in a pro ess of imitation— for all knowledge is imitation—but whereas the notions of the philosopher imitate the reality of the Ideas the i nages of the poet imitate sen sible appearances which are themselves imita tions of the Ideas or eternal Forms. Even when it is accurate or truthful poetry must there fore be an inferior form of kno vledge In Plato s terms it is on the level of opin on along with fancy and belief. In any case t mu t sub mit to being judged by the same standards of accuracy as anything else which claims to be knowledge or right opinion Imitations he writes are not to be judged of by pleasure and false opinion They are to be judged of by the standard of truth and by no other what ever The competent judge of poetry must therefore possess three things he must know in the first place of what the imitation is sec ondly he must know that it is true and thirdly that it has been well executed in words and melodies and rhythms

The issue concerning poetry and truth can be most sharply drawn bet veen Plato and Aris totle precisely because Aristotle thinks that poetry is a form of imitation but that knowl edge does not have the character of imitation at all Since poetry is not a kind of knowledge the same standards do not apply to both There is not the same kind of correctness he insists in poetry as in politics —or in medicine or any other special science The poet s art is at fault if he meant to describe the thing correctly but failed through lack of po er of expression But if a technical error in phys iology enters into his description because he meant to describe the thing in some incorrect way (*e g* to make the horse in movement have both right legs thrown forward) then ac cording to Aristotle his error in that case is not in the essentials of the poetic art The poet s obligation is not to be truthful in such particulars but to make his whole story seem plausible Aristotle summarizes his position in the statement of his famous rule concern ing the probable and the possible For the purposes of poetry he says a convincing im possibility is preferable to an unconvincing pos s bility

Connected with this i sue concerning the kind of truth to be expected from the poet is the cont oversy over the purpose of poetry— to instruct or to delight or to do both This in turn relates to the moral problem of the in fluence poetry can have on human character or virtue and to the political problem of the reg ulation of poetry by the state or the right of poetry to be free from such censorship It is not surpris ng that Plato conce ving poetry he does should b nish poets f om the ideal state des ribed in the *Rep blic* or that he should lay

down specific regulations for the content of poetry in the *Laws*

At the opposite extreme are those who like Milton and Mill attack the principle of censorship itself—as applied to poetry as well as to other forms of communication But the traditional defense of poetry in essays bearing that title from the pen of Sidney and Shelley or in the writings of Chaucer Montaigne and Cervantes usually tries to answer Plato by praising poetry as an instrument of moral instruction as well as of delight Waiving the question of its effect upon morals some like Adam Smith answer the sort of criticism Augustine levels against pagan poetry and theatrical presentations by holding the theatre to be a legitimate a lawful even a necessary means of recreation

Some of these issues touch on considerations dealt with in other chapters The problem of censorship is discussed in the chapters on Art and Liberty and the theory of imitation as applied to the arts in general useful as well as fine is discussed in the chapter on Art Here we are concerned with the bearing of that theory upon the nature of poetry The difference we have observed between Plato and Aristotle concerning imitation itself does not seem to affect their use of this notion in treating works of fine art and more particularly poetry What Hamlet tells the players is the purpose of their play— to hold as twere the mirror up to nature —Aristotle says is the aim of such arts as poetry sculpture painting music and the dance which give both instruction and delight through imitation

Within the sphere of the fine arts the distinction of poetry from the others is usually made in terms of the medium of imitation Poetry according to Aristotle imitates through the medium of language painting and sculpture through lines planes colors and shapes music through rhythm and harmony Whether Aristotle s statement that the objects of imitation are men in action applies to poetry alone or to all the fine arts is a question of interpretation to which opposite answers have been given Some commentators seem to think that human action as the object of imitation specifically defines poetry whereas music and sculpture have distinct objects as well as distinct mediums of imitation Others hold that human action is the object of imitation common to all the arts

However this issue is resolved the differentiation of the kinds of poetry can be made neither in terms of the object nor the medium of imitation but only in terms of the manner The medium being the same and the object the same Aristotle writes the poet may imitate by narration—in which case he can either take another personality as Homer does or speak in his own person unchanged—or he may present all his characters as living and moving before us

Plato makes the same distinction pointing out that the Homeric type of poetry combines both the discourse of the poet and the discourse of his characters in dialogue He calls stage plays pure imitations in the sense that the author never speaks directly but tells his story entirely through the actions and speeches of the characters whereas the type of poetry which he calls narrative as opposed to imitative may combine both methods of storytelling or may in some extreme instances never resort to dialogue at all

Since all storytelling is narration and since all poetry is imitation it seems slightly confusing to call the two major types of poetry narration and imitation as Plato sometimes does or narrative and dramatic as Aristotle sometimes does Bacon also speaks of narrative and dramatic or representative poetry He defines narrative poetry as such an exact imitation of history as to deceive did it not often carry things beyond probability and dramatic poetry as a kind of visible history giving the images of things as if they were present whilst history represents them a past

The difficulties of language seem to be removed by other terms which both Plato and Aristotle use to express the main distinction The manner of storytelling exemplified by Homer which either employs direct narration without dialogue or combines both is *epic* poetry That which uses dialogue alone is *dramatic*

These words— epic and dramatic —may have their difficulties too especially for the contemporary reader unless a number of these are remembered First epics and dramas may

be written either in prose or verse Second the arts of theatrical representation are auxiliary to the art of the dramatic poet The writing of a play is completely independent of its acting the production of spectacular effects depending as Aristotle says more on the art of the stage machinist than on that of the poet Third epic poetry differs from dramatic poetry in other respects than the use of indirect discourse as well as dialogue

On this last point Aristotle observes that all the elements of epic poetry are found in drama whereas the dramatic form may include the embellishments of song and spectacle in addition to plot character thought and diction Even more important is his distinction of the two in terms of the unities of time place and action Because it need not be limited at all in time and place epic narration may have a much more complicated plot structure or even as Aristotle says a multiplicity of plots

With this understanding of the distinction between the two major types of storytelling we can see why the great novels of Cervantes Melville Tolstoy and Dostoevsky should be classified as epic poems and were apparently so conceived by their authors at least in the cases of Cervantes and Melville As measured by the magnitude of its plot—its reach in time and its scene the whole universe from Heaven through the world to Hell —Goethe s *Faust* even though dramatic in manner seems to be no less epic in its structure and proportions than the poems of Homer Virgil, Dante and Milton The story of a single white whale can be epic in its immensity if the storyteller like Melville makes it include the whole circle of the sciences and all the generations of whales and men and mastodons past present and to come with all the revolving panoramas of empire on earth and throughout the whole universe not excluding its suburbs

ANOTHER TRADITIONAL divis on in the kinds of poetry is that between the tragic and the comic. This distinct on is variously expressed Fielding sees the difference in terms of the misery or happiness to which the poet brings his principal characters in the end Speaking of tragedy alone M lton says that it has ever been held the gravest moralest and most profitable of all other poems In similar vein Marcus Aurelius praises tragedy for reminding men of the things which happen to them and that it is according to nature for things to happen so He does not admit comedy to be of equal worth thou h he does look with some favor upon the older forms of comedy which were useful in reminding men to beware of insolence

According to Aristotle comedy represents men as worse tragedy as better than in actual life He describes the action which tragic poetry imitates as serious adding that tragedies through pity and fear effect the proper purgation of these emotions Whether comedies also arouse and purge certain emotions Aristotle does not say for his promise to speak more fully of comic poetry is not fulfilled in the *Poetics* Concerning the meaning of the tragic catharsis there are questions enough

Augustine asks How is it that a man wants to be made sad by the sight of tragic sufferings that he could not bear in his own person? The more a man feels such sufferings in himself the more he is moved by the sight of them on the stage Now when a man suffers himself it is called misery when he suffers in the suffering of another it is called pity But ho v can the unreal sufferings of the stage possibly move pity?

Boswell begs Dr Johnson to explain Aristotle s doctrine of the purging of the passions as the purpose of tragedy Why Sir Johnson replies you are to consider what is the meaning of purging in the original sense It is to expel impurities from the body The mind is subject to the same imperfections The passions are the great movers of human actions but they are mixed with such impurities that it is necessary they should be purged or refined by means of terror and pity For instance ambition is a noble passion but by seeing upon the stage that a man who is so excessively ambitious as to raise himself by injustice is punished we are terrified by the fatal consequences of such a passion In the same manner a certain degree of resentment is necessary but if we see that a man carries it too far we p ty the object of it and are taught to moderate th t passion Johnson s interpretation s ems to be more specific th n Milton s notion that to purge the pass ons by tragedy is to temper and reduce

them to just measure with a kind of delight stirr d up by reading or seeing those passions well imitated

It may be arguable whether the difference between tragedy and comedy is well defined by reference to the nobility or vulgarity of the leading characters by the contrast between the pride of the tragic and the wit of the comic hero by the seriousness or lightness of the tragic and comic themes and by the passions appropriate to each In any case it seems clear that this division of poetry crosses the other division into epic and dramatic writing The plays of Sophocles and the *Iliad* of Homer Aris totle observes are tragic poetry yet dramatic and epic respectively in manner but from an other point of view Sophocles is to be com pared with Aristophanes for though the one writes tragedies and the other comedies both are dramatists In the tradition of the great books there are comic as well as tragic epics—Chaucer s *Troilus and Cressida* Rabelais *Gargantua and Pantagruel* Cervantes *Don Quixote* Sterne s *Tristram Shandy* and Fielding s *Tom Jones*—just as there are tragic and comic plays The examination of these suggests that talk rather than action is the essence of comedy

The chief thing which Aristodemus remem bers of Socrates discourse the morning after the banquet in Plato s *Symposium* is Socrates success in compelling Aristophanes and Aga thon to acknowledge that the genius of come dy was the same as that of tragedy and that the true artist in tragedy was an artist in comedy also To this they were constrained to assent being drowsy and not quite following the argu ment Precisely what they assented to has never been entirely clear On one interpreta tion of Socrates remark examples of his point are difficult to find in the great books—except perhaps for the plays of Shakespeare which in the sphere of dramatic poetry seem to repre sent an equal genius for tragic and comic writ ing In the sphere of epic poetry we have only Aristotle s reference to a lost poem of Homer s —the *Margites*—which he says bears the same relation to comedy that the *Iliad* and *Odyssey* do to tragedy

According to another interpretation the in s ght of Socrates is that the totality of the great trag c vision tends to approximate the totality of the great comic vision The same poem may be both tragic and comic because the poet has been able to see far enough into the nature of things to reveal a world which is at once dread ful and ridiculous In this sense *Moby Dick* may be both a tragedy and a comedy Though in many of its aspects Melville writes this vis ible world seems formed in love the invisible spheres were formed in fright but he also re marks that there are certain queer times and occasions when a man takes this whole uni verse for a vast practical joke

In the science of poetics certain principles or rules seem to apply to all the major forms of poetry where others relate specifically to epic or dramatic writing or to tragedy or comedy Aristotle implies that his most general formula tions hold not only for long poems but for dithyrambic poetry as well If that is so they should be capable of extension to other forms of lyric poetry such as for example the sonnets of Shakespeare and Milton and Milton s odes and elegies Yet the two principal elements in Aris totle s analysis of poetry—plot and character—seem superficially at least to belong peculiarly to narrative poems long or short Whether they are present in any comparable manner in the structure of a lyric or whether the form and content of lyric poetry requires an analysis pe culiar to itself are among the most difficult questions in the theory of poetry

In the tradition of the great books there seems to be as already observed general agree ment about the basic rules for writing narrative poetry Since these rules aim to direct the artist toward the achievement of excellence they are also the basic principles of criticism The science of poetics is at once an organon of production and a canon of criticism

The simple rules such as those of plot con struction afford an example A well constructed plot must have a beginning middle and end It must observe certain unities (at least of ac tion if not of time and place) Certain effects it is held can be produced by the use of recognition scenes and reversals of fortune Whether the events narrated are possible or impossible the poet must at least invest them with plausibility or verisimilitude Such rules, formulated by Aristotle and discussed by Cer-

vantes Fielding and others provide standards for judging whether a poem is skillfully made as well as give directions for the attainment of skill by the poet

It may be held of course that the great poet works by inspiration by a divine madness rather than by rule that as Theseus says in *A Midsummer Night s Dream* the lunatic the lover and the poet are of imagination all compact The poet s eye in a fine frenzy rolling doth glance from heaven to earth from earth to heaven and as imagination bodies forth the forms of things unknown the poet s pen turns them to shapes and gives to airy nothing a local habitation and a name But if there is an art of poetry then like any other art it is a thing of rules whether or not genius needs their guidance or can be regulated by them

The pivotal question here is Which takes precedence the creative or the critical faculty? Does Aristotle s rule concerning the primacy of plot derive from the greatest poems of antiquity in which he found this principle observed? Does it set up an infallible measure of excellence in narration or on the other hand do certain modern novels have an impeccable greatness despite their violation of this rule by the emphasis they place on the development of character rather than on the action in which the characters are involved? The rule of probability and necessity may on the other hand be inviolable Not even the most original genius may be able to tell a good story without giving it poetic truth according to the necessities of the characters he has created and the probabilities of the situations in which he places them

ON THE SIDE of language poetic theory seems to draw much from the art of rhetoric The relation of rhetoric to poetics the nature of rhetorical devices such as metaphor and simile the cho ce among existing words or the invention of new ones a e matters dealt with in the chapter on RHETORIC as well as here Aristotle s treatment of these problems both in his *Rhetoric* and his *Poetics* lays the foundation for the traditional association of these two disc plines In both for example he discusses the various modes of metaphor and the r util ty in ach ev ing an expansion of mean ng combined with a contraction of speech

This in turn relates to his general maxim of style which directs the writer to be clear with out being ordinary The clearest style he says is that which uses only current or proper words but in order to avoid being common place or ordinary it must be admixed with lofty diction— raised above the common place by the employment of unusual words

Nothing contributes more to produce a clearness of diction that is remote from com monness than the lengthening contraction and alteration of words Phrases which are not part of current idiom give distinction to style

But the greatest thing by far is to have a command of metaphor This alone cannot be imparted by another it is the mark of genius for to make good metaphors implies an eye for resemblances

One part of Aristotle s theory of style seems to be amplified by Pascal s observation that a certain perfection is achieved by the use of those words which if altered would spoil the discourse In these terms prosaic as opposed to poetic writing does not result from the lack of a fixed metre but rather from commonplace ness or lack of distinction in language This standard of style does not apply to poetry alone for just as history and philosophy may be writ ten in prose or verse so also may they be writ ten poetically or prosaically

Dr Johnson s point that poetry cannot be translated that the beauties of poetry cannot be preserved in any language except that in which it was originally written may be ca pable of the widest generalization It may be ex tended to mean that writing which is poetic cannot be translated into any other form of words even in the same language A poetic sentence in English is untranslatable in this ab solute sense when no alternative Engl sh phras ing is truly its equivalent For example it seems impossible to re state without loss or ruin Shakespeare s Life is a tale told by an idiot full of sound and fury signifying nothing or Hobbes Life in a state of nature is solitary poor nasty brutish and short

The other part of Aristotle s theory of style that concern ng metaphors seems to be con verted by William James into a gen ral d stinc tion between poet c and philosophic thought o what he calls the splend d and the analytic

types of intellect Poetic thought tends to develop the implications of an analogy without giving an explication of its grounds This in James view explains the abrupt transitions in Shakespeare s thought which astonish the reader by their unexpectedness no less than delight him by their fitness Quoting a passage from Homer unfathomably rich in metaphor he says that a man in whom all the accidents of an analogy rise up as vividly as this may be excused for not attending to the ground of the analogy The two types of intellect are rarely found in conjunction—Plato according to James being one of the few exceptions whose strangeness proves the rule

ON THE LEVEL of thought and knowledge as opposed to that of language poetry is traditionally contrasted to philosophy and history As indicated in the chapter on HISTORY historians like Herodotus Thucydides and Plutarch emphasize the difference rather than the similarity the historian is a reporter of fact the poet a creator of fables or fictions The one gains credence by his display of evidence and reasons the other by the intrinsic plausibility of his tale

In a good poem writes Hobbes whether it be epic or dramatic both judgment and fancy are required but the fancy must be more eminent In a good history the judgment must be eminent because the goodness consists in the method in the truth Fancy has no place but only in adorning the style

Bacon associates poetry most intimately with history both being concerned with individuals circumscribed by time and place and differing only as one employs the imagination the other the memory Aristotle on the other hand finds poetry and philosophy more alike at least to the extent that poetry unlike history tends to express the universal by which he means how a person of a certain type will on occasion speak or act according to the law of probability or necessity Even if the poet chances to take an historical subject he is none the less a poet for there is no reason why some events that have actually happened should not conform to the law of the probable and possible and in virtue of that quality in them he is their poet or maker In this sense the historian also may turn poet Referring to the speeches in his history Thucydides tells us that it was his habit to make the speakers say what was in my opinion demanded of them by the various occasions of course adhering as closely as possible to the general sense of what they really said

Some of the great poems notably the *Divine Comedy Paradise Lost* and *Faust* are frequently called philosophical for what appear to be other reasons either because the discourse of their characters is weighted with doctrine or because the poet himself is expressing a doctrine not in particular speeches nor by argument but in the symbolism of the poem as a whole By these criteria Lucretius *On the Nature of Things* is a philosophical work, but not a philosophical poem It is argumentative throughout not narrative at all it aims to be a literal rather than an allegorical statement of the truth Bacon s definition of allegorical poetry—as that which represents intellectual things to the senses —seems to characterize both the poetic aspect of philosophy and a distinctively philosophical type of poetry

Yet Aristotle s point, that poetry and philosophy are alike may remain valid All poetry certainly all the great narrative poems, the great epics and dramas novels and plays, deal with the abiding problems of human action and the perennial themes of human thought It is not this moral or metaphysical content however which makes poetry more philosophical than history It is the poet s treatment of such matters In the persons and events of his story he succeeds in giving the universal a concrete embodiment Precisely because these are only imaginary not real particulars they permit the abstract universal to be readily disengaged

Poets like Chaucer and Cervantes who insist that their function is to instruct as well as to delight do not assume the role of pedagogues or preachers. They teach not dogmatically but as experience does by affording the mind the materials or occasions for insight and inference. As an artistic imitation poetry may be better than the experience it represents It may improve upon experience as a teacher because born of the poet s mind it is already impregnated with ideas

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the passages referred to For example in 4 HOMER *Iliad* BK II [265 283] 12d, the number 4 is the number of the volume in the set the number 12d indicates that the passage is in section d of page 12

PAGE SECTIONS When the text is printed in one column the letters a and b refer to the upper and lower halves of the page For example in 53 JAMES *Psychology* 116a 119b the passage begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed in two columns the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page For example in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

AUTHOR S DIVISIONS One or more of the main divisions of a work (such as PART BK CH SECT) are sometimes included in the reference line numbers in brackets are given in certain cases e g *Iliad* BK I [265 283] 12d

BIBLE REFERENCES The references are to book chapter and verse When the King James and Douay versions differ in title of books or in the numbering of chapters or verses the King James version is cited first and the Douay indicated by a (*D*) follows e g OLD TESTAMENT *Nehemiah* 7 45—(*D*) *II Esdras* 7 46

SYMBOLS The abbreviation esp calls the reader s attention to one or more especially relevant parts of a whole reference passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited

Chapter 70 PRINCIPLE

INTRODUCTION

OF the three ways in which principles are considered in the tradition of the great books the most familiar sense of the word is the one in which we speak of moral principles principles of action or political principles The connotation of the word in this usage seems to be twofold We think of principles as rules of conduct and we think of them as standards by which to measure and judge human acts or political events Either conception attributes a certain generality to principles Just as rules apply to an indefinite number of particular cases so any principle we appeal to in order to decide a practical problem or to weigh the merits of an action undertaken can be applied again and again in other circumstances

In addition to this characteristic of generality principles seem to have the quality of *underlying* or being the *source of* other things In jurisprudence the search for principles consists in the attempt to discover those few most fundamental precepts from which the more detailed rules of law can be derived The constitution of a state provides the principles which underlie its particular laws and sets the standards by which their legality is to be measured Governments are judged by the principles they attempt to apply as well as by their success in putting these principles into practice To say of a government that its acts are *unprincipled* is not to condemn the particular acts as wrong but to accuse the government of having no uniform policy to serve as a foundation for its acts

This aspect of the meaning of principle—as the source from which a set of consequences follows—seems to be more characteristic of the idea of principle than the aspect of generality According to its Latin derivation and the equivalent root in Greek principle means a beginning or a foundation Sometimes it means that which comes first absolutely in the sense of being before everythin else sometimes it means that which comes first only relatively taking precedence over some things but having others prior to itself Since priority may be either absolute or relative—first without qualification or first only in a certain respect—the traditional phrase first principle does not have the redundancy of first first or beginning beginning

If there are absolutely first beginnings, to which nothing else can be prior they can legitimately be called first principles to distinguish them from principles which come first only in a certain respect Only if there are first principles can regression to infinity be avoided in the search for origins The propositions which lie at the foundation of a science may for example constitute its principles but they may also be derived in turn from some prior science Only the principles of a science which is prior to or independent of all others can be truly first principles

THE FOREGOING example brings us to the other meaning of principle that is popularly recognized It is the sense in which men speak of principles in relation to conclusions or of principles as the foundations of a science

The priority which belongs to principles in the domain of thought need not be temporal Principles may or may not be first in the order of learning But if they are not first in the temporal order they must be first logically as premises are logically prior to a conclusion or as in Euclid s *Elements* his principles—his definitions postulates and axioms—are logically prior to all the theorems he demonstrates by means of them

It may be asked whether among propositions related as premises and conclusions, the logical priority of one proposition to another

is sufficient to make the prior proposition a principle Can a proposition be a principle if even though it is used as a premise in reasoning it lacks generality? For example is the particular proposition—that this bottle contains poison—a principle underlying the practical conclusion that its contents should not be swallowed?

Aristotle answers affirmatively In the order of practical thinking he holds we deliberate neither about the end to be sought nor about the particular facts on which a choice of the means depends The end cannot be a subject of deliberation he writes but only the means nor indeed can the particular facts be a subject of it as whether this is bread or has been baked as it should for these are matters of perception The perceived particulars thus function as principles along with the most general of all practical propositions namely what the end should be. Calling the faculty which apprehends first principles intuitive reason Aristotle says that the intuitive reason involved in practical reasonings grasps the last and variable fact *i e* the minor premise For these variable facts are the starting points for the apprehension of the end since the universals are reached from the particulars of these therefore we must have perception and this perception is intuitive reason

Perception at least in the form of *sense*-percept on seems to be only one of the two ways in which we apprehend the particular facts which are principles in practical reasoning Like Aristotle Aquinas uses the judgment that *this is bread or iron* as an example of facts received through the senses which are principles accepted in the inquiry of counsel But the moral quality inherent in particular acts does not seem to be perceptible by the senses alone and such particular moral judgments are also involved in moral reasoning Aristotle suggests that habit (*i e* the moral habits or virtues) are the immediate source of such judgments which can be called perceptions of the particular even though they are not simply sense-perceptions

Of first principles Aristotle explains we see some by induction some by perc ption some by a certain habituation By induction we see the general truths by sense percept on the sensible particulars and by habituation the moral particulars Hence Aristotle insists that anyone who is to listen intelligently to lectures about what is noble and just and generally about the subjects of political science must have been brought up in good habits For the fact is the starting point and if this is sufficiently plain to him he will not at the start need the reason as well for the man who has been well brought up has or can easily get the starting points

The word principle is used by Kant in a much more restricted sense He reserves the status of principle to the general propositions which serve as the major premises in reasoning In both the theoretic and the practical sciences principles express reason s understanding of universal and necessary relationships

Kant differs from Aristotle in other respects He differentiates between ordinary general propositions which merely serve as major premi es in reasoning and the propositions he classifies as synthetic judgements *a priori* He regards the former as principles only in a relative sense and treats the latter alone as principles absolutely He also distinguishes between those principles of the *understanding* which he thinks are constitutive of experience and those principles of the *reason* which should be used in what he calls a regulative not a constitutive manner They determine the direction and goals of thought beyond experience. But such differences concerning the nature and kinds of principles do not affect the commonly accepted meaning of principle as that from which in the temporal order of learning knowledge develops or that upon which in the logical order knowledge rests

THE THIRD AND relativ ly unfamiliar sense in which princ ples are discussed in the great books does not refer to the sources of man s moral decisions political acts or scientific conclusions The discussion in question refers to reality apart from man Just as men try to discover the elements of matter or the causes of mot on so they try to discover the prin ples of existence and of change The issues wh h arise from this conc rn with th princ ples of real ty are discussed in such hapt rs BEING CAUSE CHANGE FORM NATURE and MATTER

If the word principle always connotes a beginning every special sense of principle should involve some kind of priority As we have already observed principles may be either prior in time or prior logically But the principles of the universe or the principles of change are not usually thought to be prior in either of these ways For them Aristotle specifies another kind of priority—priority in nature—to explain the primacy of those principles which constitute the nature of a thing In his view for example matter and form are the principles of a physical substance Since a substance composite of matter and form cannot exist until its matter and its form coexist matter and form are not prior to the substance they compose Their priority to substance consists only in the fact that that which has the nature of a composite substance *results* from the union of matter and form as its natural components Because the substance is the *natural resultant* matter and form can properly be called its *natural principles*

This way of considering principles at once suggests a close relationship among principles elements and causes and also indicates the connection between the present chapter and the chapters on CAUSE and ELEMENT The ultimate parts into which a whole can be divided may be its principles as well as its elements The form or matter of a substance may be in Aristotle s theory not only one of its principles but also a cause—a formal or a material cause Among the great authors Aristotle and Aquinas alone seem to dwell upon the relationship of these three terms They give instances in which the same thing is principle element and cause as well as instances in which a principle is neither a cause nor an element *e g* privation In the sphere of human conduct an end is both a principle and a final cause but not an element The last end is the highest final cause and the first principle—first in intention though last in attainment

THE TRADITIONAL issues concerning this idea differ according to the general context in which the question of principles is raised The main controversy for example with regard to principles in the order of reality is over their number and order

Aristotle argues against an infinite number of principles as incompatible with the very notion of principle itself In his analysis of change or motion he tries to prove that no more than three principles are necessary and no less will do These are as the chapter on CHANGE explains matter form and privation. Considering the principles of the universe as a whole Plotinus also enumerates three and tries to prove that none can be added or subtracted. But whereas Aristotle treats the three principles of change as coordinate Plotinus places the cosmic principles in the absolute order of first, second and third

We need not go seeking any other Principles writes Plotinus This—the One and the Good—is our First next to it follows the Intellectual Principle the Primal Thinker and upon this follows Soul Such is the order in nature The intellectual realm allows no more than these and no fewer Those who hold to fewer Principles must hold the identity of either Intellectual Principle and Soul or of Intellectual Principle and The First To increase the Primals by making the Supreme Mind engender the Reason Principle and this again engender in the Soul a distinct power to act as mediator between Soul and the Supreme Mind this is to deny intellection to the Soul, which would no longer derive its Reason from the Intellectual Principle but from an intermediate Therefore we must affirm no more than these three Primals

In the sense in which Plotinus conceives the three primals they are not only principles in the order of reality but are themselves the ultimate grades or modes of reality Similarly for Plato soul is not only the principle of life and thought in the universe but it also has its own existence in the realm of being For Aristotle in contrast the principles of change do not have existence in and of themselves Matter form and privation are not substances but aspects of substance They are present in every changing substance and in every change but they are only the principles *of* mutable being they are not mutable beings in themselves

Lucretius states two principles as the basic laws of nature The first is that nothing comes into being out of nothing the second that nothing is ever completely reduced to nothing

ness The word principle is obviously not being used in the same sense here as when it designates The One for Plotinus soul for Plato matter for Aristotle or the atoms which Lucretius calls the first beginnings Here it does not refer to an entity or even to an aspect of some real being but rather to a law—the statement of a universal and necessary condition which governs all that is or happens It is in this sense that the proposition traditionally called the law of contradiction —that the same thing cannot both be and not be in the same respect at the same time—is said by Aristotle to be the first principle of being as well as of thought

The conception of the law of contradiction and the related laws of identity and excluded middle as principles of thought raises problems about logical principles in general—whether they are axioms or postulates whether they are merely rules of reasoning and demonstration or are themselves premises from which conclusions can be deduced If for example the law of contradiction is *only* a rule of thought which forbids the mind to affirm and deny the same proposition then it is not a principle of knowledge in the sense in which the definitions and axioms of geometry function as premises in the demonstration of theorems No conclusion can be drawn from it concerning the nature of things But if in addition to being a rule of thought it is a metaphysical axiom which states the most fundamental fact about existence then like the axioms in geometry it may be the source of conclusions in metaphysics

On this second point Locke seems to differ sharply from Aristotle and Aquinas He denies that the laws of identity and contradiction are fruitful princ ples of knowledge These magnified maxims he writes are not the principles and foundations of all our other knowledge Nor have they been he adds the foundations whereon any science hath been built There is I know a great deal of talk propagated from scholastic men of sciences and the maxims on which they are built but it has been my ill luck never to meet with any such sc ences much less any one built upon these two maxims what is is and t is impossible for the same thing to be and not to be

WE SHALL PRESENTLY consider the issue concerning axioms or postulates—whether the principles of the sciences are self evident truths or are only provisional assumptions Those who are willing to admit the existence of axioms do not all agree however that such truths refer to reality Hume for example limits the content of axioms to knowledge of the relations between our own ideas They are not truths about real existence or matters of fact

Locke also grants self evidence only to perceptions of the agreement or disagreement between ideas Concerning the real existence of all other beings except ourselves and God we have he writes not so much a demonstrative much less a self evident knowledge and therefore concerning these there are no maxims But Locke does think that our demonstrative knowledge of God s existence depends upon an intuitive knowledge of our own existence and in addition to knowing our own existence directly or without proof he also thinks we have through our senses an equally direct knowledge of the existence of other things Such intuitive and sensitive knowledge of particular existences is like the truth of axioms immediate—that is something known directly or without proof without any appeal to prior propositions Hence Locke is not denying that we know some immediate truths about reality but only that such truths consist exclusively of propositions about particular existences Since axioms or what Locke calls maxims are always general propositions the self evident truths which they express do not apply to reality

William James uses the word intuitive — in a different sense from Locke—to characterize propositions that state the necessary *and eternal relat ons wh ch the mind finds* between certain of its ideal conception Intuitive propositions are for him therefore what maxims are for Locke and like Locke James also denies that such axioms of reason hold for reality Only *hypo heti ally* he says can we affirm intuitive truths of real things—by suppos ng namely that real things exist wh ch co respond exactly w th the ideal ubject of tł e intuitiv proposit ons The intuitive propos tions of Locke leave us s gards outer real ty none the b tt r fo the r pos ession We

still have to go to our senses to find what the reality is

The vindication of the intuitionist position James continues is thus a barren victory The eternal verities which the very structure of our mind lays hold of do not necessarily themselves lay hold on extramental being nor have they as Kant pretended later a legislating character for all possible experience They are primarily interesting only as subjective facts They stand waiting in the mind forming a beautiful ideal network and the most we can say is that we *hope* to discover outer realities over which the network may be flung so that ideal and real may coincide

The opposite view seems to be taken by Plato Aristotle Aquinas Bacon Descartes Spinoza and Kant Though they are far from being in complete agreement concerning the principles of knowledge the propositions which they call axiomatic self evident intuitive or *a priori* synthetic judgments are not restricted by them to the mind s perception of the relations between *its own* ideas There are self evident or immediate truths in physics and metaphysics as well as in mathematics and logic Whether these are inductions from experience or innate possessions of the mind whether they are intuitive apprehensions of intelligible being or *a priori* judgments having a transcendental origin these propositions are held to describe the world of experience or the nature and existence of things outside the human mind

There seem to be two degrees of skepticism with regard to principles in the order of knowledge Complete skepticism would consist in denying principles in every sense That would be the same as denying any beginning or bases for even the opinions which men hold No one seems to go that far

The issue with respect to the foundations of knowledge or opinion is therefore not between those who affirm and those who deny principles but between different views of what the starting points are It is sometimes said for example that sensations are the principles or beginnings of all human learning This view is shared both by those who think that all our ideas or concepts are abstracted from the materials provided by the senses and by those who account for all the other contents of the mind —its memories and imaginations its complex formations—in terms of the simple impressions originally received by the senses

Concepts as distinct from sense perceptions, are also sometimes regarded as principles of knowledge by those who think that concepts originate by abstraction from sensory materials as well as by those who think that ideas are primary principles *i e* having no origin in any prior apprehensions On either view ideas or concepts function as principles insofar as they are the simples from which the more complex acts of the mind develop such as the acts of judgment and reasoning Just as on the level of language words are the principles of all significant speech out of which sentences and paragraphs are formed just as in the logical order terms are said to be the principles of propositions and syllogisms so concepts are the principles of judgments and reasonings. The definitions of Euclid for example state the notions of *point* line triangle etc which underlie his theorems and demonstrations

One common characteristic of either sensations or concepts as principles of knowledge seems to be *simplicity* Nothing more elementary out of which they can be formed is prior to them Another characteristic is that they are principles of knowledge or opinion without being themselves acts of knowledge or opinion. This point is made by all who hold that only propositions—whether statements of opinion or of knowledge—can be true or false

The terms which express the simple apprehensions of the mind—its sensations or concepts—cannot be true or false because unlike propositions which are composed of terms, they do not assert anything If sensations and concepts cannot be true or false in the sense in which propositions or judgments are then they lack the *distinctive property* of knowledge or opinion In contrast propositions or judgments —which are supposed to be principles whether axioms or assumptions—can be treated as themselves expressions of knowledge or opinion n merely as its starting points or sources

The two degrees of skepticism previously mentioned apply only to those principles o

knowledge which are themselves capable of being regarded as knowledge or opinion and hence as either true or false

We have already considered the skepticism of those who admitting that the truth of some propositions can be immediately recognized by the mind nevertheless deny that such self evident truths describe reality This may or may not be accompanied by a further deprecia tion of axioms on the ground that they are merely analytical propositions and hence tri fling uninstructive or tautological

The chapter on JUDGMENT considers the is sue which revolves around the derogatory use of such words as tautology or truism to designate self-evident truths Though the in vidious connotation of the word truism does not make the truth to which this epithet is ap plied any less true the dignity of a truth does seem to be affected by the refusal to regard it as a statement of reality Furthermore a certain degree of skepticism results from such refusal Hume exemplifies this He holds that self evident truths are possible only in mathematics which deals not with matters of fact but with the relations between our own ideas In con sequence he denies to the study of nature the certitude or demonstrative character which he finds in mathematical science Since physics is concerned with real existences no axioms or self evident principles are available to it and so according to Hume it cannot demonstrate its conclusions but must advance them as probabilities.

A more thorough going skepticism seems to consist in holding that there are absolutely no matters at all about which men have axiomatic knowledge This appears to be the pos tion of Montaigne No truths are self evident None commands the universal assent of mankind none belongs to the nature of the mind so that all men must agree to it Montaigne almost holds it to be axiomatic that there are no axioms for if there were he says there would be some one thing to be found in the world that would be believed by men with an univer sal consent but this that there is no one propo sition that is not debated and controverted amongst us or that may not be makes it very manifest that our natural judgment does not very clearly comprehend what it embraces

If it is objected that in the absence of such principles there is no starting point or founda tion for science Montaigne seems willing to accept the consequence He does not flinch from an infinite regression of reasons No rea on he writes can be established but upon the foundation of another reason and so run back to all infinity To those who say that there is no disputing with persons who deny principles he replies that men can have no principles if not revealed to them by the Divinity of all the rest the beginning the middle and the end are nothing but dream and vapor

If however for practical purposes a begin ning must be made somewhere Montaigne sug gests that it can be done by taking things for granted and then getting others to grant our presuppositions It is very easy he writes upon granted foundations to build whatever we please By this way we find our reason well grounded and discourse at a venture for our masters prepossess and gain beforehand as much room in our belief as is necessary for them towards concluding afterwards what they please as geom ters do by their postulates the con ent and approbation we allow them giving them power to draw us to the right and left and to whirl us about at their own pleasure

IF THE ONLY principles upon which reasoning can be based or from which conclusions can be drawn are assumptions postulates or hypoth eses rather than axioms then everything is a matter of opinion and probability nothing can have the certitude of knowledge As indicated in the chapters on KNOWLEDGE and OPINION one theory of that distinction makes knowl edge an act of the mind independent of our wishes or will and treats opinion as a judgment voluntarily accepted or rejected Accordingly assumptions or postulates are perfectly repre sentative of opinion and axioms express the very essence of knowledg To assume or pos tulat anything is to take it for granted— voluntarily! A postulate neither comp ls as sent nor does it ever excl id th poss bil ty of taking the opposite for granted Whe e men make postulates there dispute is poss ble But to assert something as an ax om is to command assent on the ground that its opposite can be

immediately recognized as impossible No proposition can be regarded as an axiom if its acceptance or rejection is in any way a matter of choice

For Aristotle the area in which men can dispute with some reason on both sides belongs to what he calls dialectic whereas what he calls science is the area from which dispute is excluded by demonstrations which rest on self evident truths One is the area of probability and opinion the other of certainty and knowledge Contrary assumptions are the starting point of dialectical argument whereas science begins with axioms These may be the first principles which Aristotle and Bacon call common notions because they are common to diverse sciences or they may be the axioms peculiar to a single subject matter

The word dialectic is used by Plato in a quite different sense It names the highest science Whereas the mathematical sciences start from hypotheses which require further support dialectic—in the conception of Plato—rises to the first principles of all knowledge In the hierarchical ordering of the sciences Plato s dialectic Aristotle s metaphysics and Bacon s *philosophia prima* seem to occupy respectively the same primary position and to perform the same function in virtue of being the discipline which contemplates or considers the absolutely first or most universal principles For Bacon as for Aquinas the only higher science is sacred theology whose principles are articles of supernatural faith not axioms of reason

These matters are more fully discussed in the chapters on DIALECTIC METAPHYSICS and THEOLOGY questions concerning different kinds of principles or the principles of different sciences are considered in HYPOTHESIS and LOGIC The chapter on INDUCTION furthermore discusses the inductive origin of axioms as well as the disagreement between Bacon and Aristotle on the point of whether the highest axioms or first principles are immediately intuited from the particulars of experience or are reached only through intermediate stages of generalization

Since axioms are indemonstrable they cannot be derived by reasoning as conclusions from any truths prior to themselves Their indemonstrability is regarded by Aristotle and Pascal as a virtue rather than a defect for if they were demonstrable they could not be the principles or starting points of demonstration If there were no axioms then nothing could be demonstrated because everything in turn would require proof in an endless regression

To the ancient counterparts of the skeptical Montaigne Aristotle replies that unless the law of contradiction is an indisputable axiom any form of reasoning even probable reasoning from assumptions is impossible The principle which underlies all disputation cannot itself be disputed To those who with skeptical intent, insist upon having everything demonstrated before they will accept it Aristotle offers an indirect defense of the law of contradiction by asking the questioner to try denying that self evident principle without reducing himself to absurdity

Those who acknowledge the existence of axioms generally agree that they are indemonstrable truths but some like Descartes and Kant do not agree that they are inductions from experience The alternatives seem to be that axioms are innate possessions of the intellect or that they are transcendental *a priori* principles of pure reason independent of experience Yet Locke who denies innate ideas and principles or anything prior to experience does not treat what he calls self evident maxims as inductions from experience They are rather direct perceptions of agreement or disagreement among the ideas we have acquired through experience

Aquinas who no less than Locke denies innate ideas and insists upon sense experience as the source of all human knowledge refers to the assent we give first principles as a *natural habit* of the mind—the intellectual virtue he calls understanding equivalent to what Aristotle calls intuitive reason As the chapter on HABIT indicates axioms are called natural truths not in the sense of being innate instinctive or congenital but only in the sense that if the human reason functions naturally or normally it will come to recognize these truths Again like Locke Aquinas seems to be saying that the truth of axioms is perceived by the human understanding as soon as their terms are known but he does not concur

with Locke in thinking that therefore such truths hold only for relations between our own ideas

THE THEORY OF the possession of principles by natural habit has for Aquinas more than a verbal connection with the theory of natural law Of the various meanings of the phrase natural law which are distinguished in the chapter on LAW we are here concerned with what both Kant and Aquinas conceive as the moral law whose precepts are the fundamental principles of human conduct Both also speak of the precepts of the natural law or the moral law as the first principles of man s practical reason

For Aquinas these principles are primary in the order of practical truth and the moral sciences as metaphysical first principles are primary in the order of speculative truth and the theoretic sciences The precepts of the natural law he writes are to the practical reason what the first principles of demonstration are to the speculative reason because both are self-evident principles As the proposition that *the same thing cannot be affirmed and denied at the same time* is the first principle of the speculative reason so the first precept of law that *good is to be done and evil is to be avoided* is the first principle of the practical reason.

For Kant the principles of the pure practical reason which legislate *a priori* for the realm of freedom play an analogous role to the principles of the pure speculative reason which legislate *a priori* for the realm of nature or experience It is this parallelism between the two sets of principles which Kant seems to have in mind when he conceives a *metaphysic of nature* and a *metaphysic of morals* as twin disciplines founded on the speculative and the practical employment of the transcendental principles of pure reason

The same fundamental issues which we have considered in connection with the axioms of theoretic knowledge occur here in connection with the first principles of moral knowledge Aquinas and Kant disagree for example about the way in which we come into possession of these principles For Kant the principles of mortality like the principles of nature belong to the transcendental structure of pure reason itself For Aquinas as already suggested the precepts of the natural law are known in the same way as the axioms of the speculative reason As the truth of the principle of contradiction is known when we understand the meaning of is and not so the truth of the first command of natural law— Seek the good —is known when we understand the meaning of seek and good We hold such truths by the natural habit of our minds which in the case of the natural law is given the special name of *synderesis*

Just as we find a certain skepticism with regard to the principle of contradiction and other axioms so we find doubts about the existence of natural law or about indisputable and universally acceptable principles of morality Referring to those who think that there are some laws first perpetual and immutable which they call natural that are imprinted in mankind by the condition of their own proper being Montaigne declares that the only sign by which they can argue or infer some laws to be natural is the universality of approbation and he adds Let them produce me but one of this condition

The consequences of skepticism are here the same as before Without first principles moral science either fails entirely or is reduced to systems of belief based upon one set of assumptions or another In either case moral judgments express not knowledge but opinion As John Stuart Mill observes the utilitarians must despite all other differences agree with Kant that if there is to be a science of ethics mortality must be deduced from principles and ultimately from one first principle for if there be several there should be a determinate order of precedence among them

What Mill says concerning the self evidence of the first principle of morality—which he formulates as a statement of the ultimate end of human conduct—closely resembles what Aristotle says about the self-evidence of the law of contradiction Questions of ultimate ends are not amenable to direct proof Mill writes 'To be incapable of proof by reasoning is common to all first principle to the first premises of our knowledge as well as to those of our conduct

OUTLINE OF TOPICS

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay version is indicated by a (D), e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 71 PROGRESS

INTRODUCTION

LIKE the idea of evolution with which it has some affinity the idea of progress seems to be typically modern Anticipations of it may be found in an ient and mediaeval thought some times in the form of implicit denials of the idea But in explicit formulation in emphasis and importance progress like evolution is almost a new idea in modern times It is not merely more prominent in modern discussion it affects the significance of many other ideas and so gives a characteristic color or tendency to modern thought

The idea of evolution affects our conceptions of nature and man But the theory of evolution is itself affected by the idea of progress Since it was a major theme at least two centuries before Darwin progress does not depend for its signifi cance upon the theory of biological evolution. The reverse relationship seems to obtain The idea of evolution gets some of its moral social even cosmic significance from its implication that the general motion in the world of living things perhaps in the universe is a progress from lower to higher forms

Darwin thinks Von Baer has defined ad vancement or progress in the organic scale better than anyone else as resting on the amount of differentiation and specialization of the several parts of a being —to which Darwin adds the qualification that the organisms must be judged when they have ar ived at maturity As organisms have become slowly adapted to diversified lines of life their parts will have become more and more differentiated and special zed for various functions from the ad vantage gained by the divis on of physiological labor The same part appea s often to have been modified first for one purpose and then long afterwards for some other and quite dis tinct purpose and thus all the parts are ren dered more and more complex. In accord ance with this view Darwin writes it seems if we turn to geological evidence that organiza tion on the whole has advanced throughout the world by slow and interrupted steps In the kingdom of the Vertebrata it has culminated in man

Whether strictly biological evolution has a single or uniform direction may be disputed in the l ght of evidences of regression and the mul tiplication of lower as well as higher forms But Darwin seems to think that since natural se lection works solely by and for the good of each being all corporeal and mental endowments will tend to progress toward perfection What ever the evidence may be the popular notion of evolution especially when applied by writers like Herbert Spencer to human society or civi lization connotes progress—the gradual yet steady march toward perfection

APART FROM THIS APPLICATION of the idea of evolution to man s world progress seems to be the central thesis in the modern philosophy of history In the minds of some the philosophy of history is so intimately connected with a theory of progress that the philosophy of his tory is itself regarded as a modern development There seems to be some justification for this view in modern works on the tendency of his tory which have no ancient counterparts such as the writings of Vico Condorcet Kant Proudhon Comte J S Mill Hegel and Marx

These writers do not all define or explain progress in the same way Nor do they all sub-scribe to an inviolable and irres stible law of progress which has the character of a divine ordinance replacing or transforming less opti mistic views of providence But for the most part the moderns are optimists Th y ither be lieve in man s perfectibil ty and i i his approach to perfection through his own eff

turned toward the realization of ideals, or they see in the forces of history—whether the manifestations of a world spirit or the pressure of material (i.e., economic) conditions—an inevitable development from less to more advanced stages of civilization according to a dialectical pattern of conflict and resolution, each resolution necessarily rising to a higher level.

As opposed to the optimism of expecting a continual improvement in all things or an irreversible ascent to new heights, the pessimistic view denies that progress is either the law or the hope of history. It believes rather that everything which goes up must come down. As indicated in the chapter on HISTORY, the theory of cycle after cycle of rise and decline—or even the notion that the golden age is past, that it is never to be regained, and that things are steadily getting worse—prevails more in the ancient than in the modern world.

The modern exceptions to optimism in the philosophy of history are notably Spengler and, to a much less extent, Toynbee. But modern pessimism never seems to reach the intensity of the Preacher's reiteration in Ecclesiastes that "there is no new thing under the sun" and that "all is vanity and vexation of spirit." Nor does the modern theory of cycles of civilization, even in Vico, seem to be as radical as that of the ancients. In his vision of cosmic cycles Lucretius sees the whole world crumbling into atomic dust to be reborn again. Herodotus does not relieve the gloom of his observation that in the life of cities "prosperity never continues long in one stay." The eternity of the world means for Aristotle that "probably each art and each science has often been developed as far as possible and has again perished."

LEAVING TO THE chapter on HISTORY the discussion of progress so far as it concerns an explicit philosophy of history, we shall here deal with considerations of progress as they occur in economics, in political theory, in the history of philosophy and the whole intellectual tradition of the arts and sciences.

In this last connection, the great books play a dual role. They provide the major evidence which, on different interpretations, points toward opposite answers to the question whether or not there has been progress in the tradition of western thought. Whatever their readers may think on this subject, the great authors, having read the works of their predecessors, offer their own interpretations of the intellectual tradition. In many cases, especially among the modern writers, their point of departure—even the conception they entertain of the originality and worth of their own contribution—stems from their concern with a deplorable lack of progress, for which they offer new methods as remedies.

Before we enter upon the discussion of economic, political, or intellectual progress, it seems useful to distinguish between the *fact* and the *idea* of progress. When men examine the fact of progress, they look to the past and find there evidence for or against the assertion that a change for the better has taken place in this or that respect. Two things are involved: a study of the changes which have occurred and the judgment—based on some standard of appraisal—that the changes have been for the better. But when men entertain the idea of progress, they turn from the past and present and look to the future. They regard the past merely as a basis for prophecy and the present as an occasion for making plans to fulfill their prophecies or hopes. The fact of progress belongs to the record of achievement; the idea of progress sets a goal to be achieved.

This distinction seems to be exemplified by the difference between ancient and modern considerations of progress. The ancients observe the *fact* of progress in some particulars—almost never universally. Thucydides, for example, in the opening chapters of his *History*, contrasts the power and wealth of the modern city states of Greece with "the weakness of ancient times." "Without commerce, without freedom of communication either by land or sea, cultivating no more of their territory than the exigencies of life required, destitute of capital, never planting their land (for they could not tell when an invader might not come and take it all away, and when he did come they had no walls to stop him), thinking that the necessities of daily sustenance could be supplied at one place as well as another, they cared little for shifting their habitation, and consequently neither built large cities nor attained to any other form of greatness."

But Thucydides does not seem to draw from these observations any general idea of prog ress He does not concretely imagine a future excelling the Periclean age in the magnitude of its wars and the magnificence of its wealth as that period dwarfs antiquity He does not infer that whatever factors worked to cause the ad vance from past to present may continue to op erate with similar results It might almost be said that he does not think about the future certainly he does not think of it as rich in prom ise Knowledge of the past he writes is an aid to the interpretation of the future which in the course of human things must resemble if it does not reflect it

Adam Smith s thinking about economic prog ress represents the contrasting modern empha sis upon the future In one sense both Thucyd ides and Smith measure economic progress in the same way though one writes of the wealth of cities the other of the wealth of nations Both Smith and Thucydides judge economic improvement in terms of increasing opulence the growth of capital reserves the expansion of commerce and the enlarged power in war or peace which greater wealth bestows But Smith in the spirit of Francis Bacon seeks to analyze the causes of prosperity in order to make them work for further progress He is the promoter of progress not merely the historian who witnesses the beneficial effect on produc tivity of an increasingly refined division of la bor and of the multiplication of machinery

To know how these things have operated to bring about the opulence of modern nations as compared with the miserable poverty of primi tive tribes or even the limited property of an c ent cities is to know how to formulate policies which shall still further expand the wealth of na tions For Smith the study of the means and methods by which economic progress has been made serves to determine the policy which is most likely to ensure even greater increments of progress in the future

Marx appears to measure econom c progress by a different standard The transition from the slave econom es of antiquity through feudal serfdom to what he calls the wa e slavery of the industrial proletar at may be accompanied by g eater productiv ty and vaster accumula tions of capital stock But the essential point for him about these successive systems of pro duction is their effect upon the status and con ditions of labor The *Communist Manifesto* notes respects in which under the capitalist system the supposedly free workingman is worse off than were his servile ancestors But if economic progress is conceived as the histori cally determined approach to the final libera tion of labor from its oppressors then capitalism represents both an advance over feudalism and a stage in the march to communism

Each successive economic revolution brings mankind nearer to the goal of the ideal or classless economy Capitalism creates the pro letariat—the revolutionary class which is to be that system s own undoing The overthrow of the landed aristocracy by the bourgeoisie thus prepares the way for the dictatorship of the proletariat as that in turn liquidates the obsta cles to the realization of the perfect communist democracy

We are not here concerned with the details of this history and prophecy but only with the theory of progress which it involves In the first place it seems to set an ultimate goal to progress while at the same time it makes prog ress a necessary feature of what is for Marx as it is for Hegel the dialectic of history Those who think that the inevitab lity of progress ought to render progress as interminable as his tory itself find some inconsistency in this tenet of dialectical materialism as well as in Hegel s notion of the necessary dialectical stages by which the Absolute Idea reaches perfect reali zation in the German state *Can progress be the inner lau of history and yet reach its goal before the end of time?*

There may be some answer to this question in a second aspect of the theory of progress which goes with a dialectic of history The progress which the successive stages of history represent resides in the quality of human insti tutions rather than in the nature of man If more economic justice or greater political lib erty is ach eved it is not because the later gen erations of men are born with a nature more disposed to goodness or v rtue but because better inst tut ons h ve e olved f om tl e con fl ct of h sto cal forc s Fu the more accord ng to Marx m n s nature is only partly de

termined at birth Part remains to be determined by the social and economic circumstances of his life—by the system of production under which he lives Hence though institutional progress may arrive at its historical goal with the establishment of the ideal economy it may be possible for further progress to be made throughout the rest of time by the improvement of men themselves when at last their natures can develop under ideal circumstances

WE HAVE NOTED TWO great issues in the characteristically modern discussion of progress Is the goal of progress definitely attainable or is its goal an ideal progressively approximated but never realized? Is progress accomplished by the betterment of human institutions or by improvements in the nature of man?

The second question has a critical bearing on the first especially for those who conceive man as infinitely perfectible It also relates to the problem of the evolutionist whether a higher form of life on earth will evolve from man or whether the future belongs to the progressive development of human nature—biologically or culturally Darwin is unwilling to admit that man alone is capable of progressive improvement but he does affirm that man is capable of incomparably greater and more rapid improvement than is any other animal

Rousseau on the other hand claims that the faculty of self improvement is one distinction between man and brute which will admit of no dispute But he also thinks that this faculty is the cause of human decline as well as progress A brute at the end of a few months he writes is all he will ever be during his whole life and his species at the end of a thousand years exactly what it was the first year of that thousand While the brute which has acquired nothing and has therefore nothing to lose still retains the force of instinct man who loses by age or accident all that his *perfectibility* had enabled him to gain falls by this means lower than the brutes themselves

One other issue concerning progress remains to be stated It raises the question of freedom or necessity in history Is progress inevitable in the very nature of the case or does it occur only when men plan wisely and choose well in their efforts to better themselves or the conditions of their lives?

In his *Idea of a Universal History* and his *Principle of Progress* Kant finds the possibility of progress in man s potentialities for improvement He regards the realization of this possibility as a work of freedom rather than a manifestation of historical necessity Political progress may have an ultimate goal—the world republic or federation of states But this according to Kant s conclusion in the *Science of Right* is an impracticable idea and serves only the regulative purpose of promoting a continuous *approximation* to Perpetual Peace Hegel s theory of the progressive realization of the idea of the state in history seems to represent the contrary position on both points. Progress is an historical necessity and it reaches an historic consummation

THE CONTRAST BETWEEN ancients and moderns with respect to political progress seems to be the same as that which we observed between Thucydides and Adam Smith with regard to wealth The ancients assert the superiority of the present over the past and even trace the stages by which advances have been made from primitive to civilized conditions But they do not extend the motion they observe into the future The moderns look to the future as to a fulfillment without which present political activity would be undirected

According to Aristotle for example the state is the last stage in the development of social life which begins with the family When several families are united and the association aims at something more than the supply of daily needs the first society to be formed is the village The village or tribal community in turn becomes the unit out of which a larger and more truly political community is formed When several villages are united in a single complete community large enough to be nearly or quite self sufficing the state comes into existence

Aristotle sees this development not merely as a progress from smaller and weaker societies to larger and more powerful ones but also as an advance toward the realization of man s political nature Absolute or despotic government by the eldest natural to the family still persists in the tribe This is the reason why the Hellenic

states were originally governed by kings because the Hellenes were under royal rule before they came together as the barbarians still are Not until the domestic or tribal form of government is replaced by political or constitutional government—not until kings and subjects are replaced by statesmen and citizens—is the state or political community fully realized

But Aristotle does not conceive the development he describes as one continuing into the future He does not imagine a larger political unity than the city state as Kant is able to envisage a world state as the ultimate formation toward which the progressive political unification of mankind should tend Though Aristotle recognizes that new institutions have been invented and old ones perfected his political theory unlike Mill s does not seem to measure the goodness of the best existing institutions by their devotion to further progress

Considering the criterion of a good form of government Mill criticizes those who separate the maintenance of order or the preservation of existing institutions from the cultivation of progress Progress includes Order he writes but Order does not include Progress Order is not an additional end to be reconciled with Progress but a part and means of Progress itself If a gain in one respect is purchased by a more than equivalent loss in the same or in any other there is not Progress Conduciveness to Progress thus understood includes the whole excellence of government

Progress fails to define good government Mill adds unless we understand by the term not merely the idea of moving onward but quite as much the prevention of falling back. The very same social causes are as much required to prevent society from retrograding as to produce a further advance Were there no improvement to be hoped for life would not be the less an unceasing struggle against causes of deterioration as it even now is Politics as conceived by the ancients consisted wholly in this

Though we no longer hold this opinion though most men in the present age profess a contrary creed *believing that the tendency of* things on the whole is toward improvement we ought not to forget that there is an incessant and everflowing current of human affairs toward the worse

According to Mill the ideally best polity is representative government on democratic principles By a just distribution of political rights and by the fullest grant of liberties it serves better than any other form of government to promote the virtue and intelligence of the people themselves This is the ultimate end of political progress Inferior forms of government such as despotic monarchy may be justified for people as yet unfit for self government but only if they also work for progress *i e* if they carry those communities through the intermediate stages which they must traverse before they can become fit for the best form of government

The whole theory of good government is thus for Mill a theory of progress in which we must take into account not only the next step but all the steps which society has yet to make both those which can be foreseen and the far wider indefinite range which is at present out of sight We must judge the merits of diverse forms of government by that ideal form which if the necessary conditions existed for giving effect to its beneficial tendencies would more than all others favour and promote not some one improvement but all forms and degrees of it

IN THE FIELD OF THE ARTS and sciences or culture generally the modern emphasis upon progress seems to be even more pronounced than in the spheres of economics and politics Lack of progress in a science is taken to indicate that it has not yet been established on the right foundations or that the right method for discovering the truth has not yet been found Lack of agreement in a particular field is the chief symptom of these defects

The fact that philosophy has been cultivated for many centuries by the best minds that have ever lived and that nevertheless no single thing is to be found in it which is not a subject of dispute and in consequence which is not dubious leads Descartes to propose his new method He hopes this may ensure progress *in philosophy of the same sort which the* new method has in his view accomplished in mathematics The *Novum Organum* of Bacon seems to be dedicated to the same end of progressively augmenting knowledge in all those

fields in which according to the inventory made in the *Advancement of Learning* of the present state of the sciences no or little progress has been made since antiquity Similarly Locke Hume and Kant insist that a study of the human mind should precede all other studies in order to save men from fruitless disputes concerning matters beyond their capacities for knowledge they hope thereby to encourage research in areas where progress can be made

The comparison of different disciplines or subject matters with respect to their progress leads to the condemnation of those which lag behind The great scientific advances of the 17th century tend to intensify the complaint about philosophy especially metaphysics The progress which has been made from the beginning in mathematics and more recently in physics means to Kant that each of these disciplines has found the safe way or the secure path of a science By comparison metaphysics has not yet even made a beginning A hundred years later William James is still to say that by comparison with the progress of knowledge in the natural sciences metaphysics belongs to the future

The notion that any field of learning has attained its full maturity seems to Bacon to be the presumption of those philosophers who seeking to acquire the reputation of perfection for their own art try to instill the belief that whatever has not yet been invented and understood can never be so hereafter When ever such belief prevails learning languishes By far the greatest obstacle to the advancement of the sciences and the undertaking of any new attempt or departure is to be found in men s despair and the idea of impossibility

THOUGH THE ANCIENTS do not evidence this presumption of perfection in their arts and sciences neither do they fret about lack of progress Nor does the disagreement of minds seem to them to signify an unhealthy condition which requires new and special methods to cure

The investigation of the truth is in one way hard in another easy writes Aristotle An indication of this is found in the fact that no one is able to attain the truth adequately while on the other hand we do not collectively fail but everyone says something true about the nature of things and while individually we contribute little or nothing to the truth by the union of all a considerable amount is amassed Aristotle puts the intellectual tradition to use by adopting the policy of calling into council the views of those of our predecessors who have declared any opinion on whatever subject is being considered in order that we may profit by whatever is sound in their suggestions and avoid their errors

But in the opinion of the moderns the intellectual tradition can also be the greatest impediment to the advancement of learning if it is received uncritically and with undue reverence for the authority of the ancients. The respect in which antiquity is held today Pascal says, has reached such extremes in those matters in which it should have the least preponderance that one can no longer present innovations without danger This is the common complaint of Hobbes Bacon Descartes and Harvey The reverence for antiquity and the authority of men who have been esteemed great in philosophy have according to Bacon retarded men from advancing in science and almost enchanted them

Harvey agrees with Bacon that philosophers or scientists should not swear such fealty to their mistress Antiquity that they openly and even in sight of all deny and desert their friend Truth Harvey has a much higher opinion than Bacon of the achievements of antiquity The ancient philosophers he writes whose industry even we admire went a different way to work and by their unweaned labor and variety of experiments searching into the nature of things have left us no doubtful light to guide us in our studies In this way it is that almost everything we yet possess of note or credit in philosophy has been transmitted to us through the industry of ancient Greece

His admiration for the ancients does not however lead Harvey to rest on their achievements When we acquiesce in the discoveries of the ancients and believe (which we are apt to do through indolence) that nothing farther remains to be known then in his opinion we suffer the edge of our ingenuity to be taken off and the lamp which they delivered us to be

extinguished No one of a surety he con tinues will allow that all truth was engrossed by the ancients unless he be utterly ignorant (to pass by other arts for the present) of the many remarkable discoveries that have lately been made in anatomy

In his own anatomical researches Harvey adopts an attitude toward the work of his predecessors both ancient and recent which remarkably resembles the attitude expressed by Aristotle toward his scientific forebears As we are about to discuss the motion action and use of the heart and arteries it is imperative on us Harvey declares first to state what has been thought of these things by others in their writings and what has been held by the vulgar and by tradition in order that what is true may be confirmed and what is false set right by dissection multiplied experience and accurate observation It is precisely this attitude which Bacon expressly condemns

Bacon sees no genuine method of science but merely a cultivation of opinion in those who prepare themselves for discovery by first ob taining a full account of all that has been said on the subject by others Those who begin in this way it is the judgment of Descartes sel dom o further Particularly the followers of Aristotle would think themselves happy he says f they had as much knowledge of nature as he had even if this were on the condition that they should never attain to any more They are like the ivy that never tries to mount above the trees which give it support and which often even descends again after it has reached the summit for it appears to me that such men also sink again—that is to say some how render themselves more ingnorant than they would have been had they absta ned from study altogether For not content with know ing all that is intellig bly explained in their au thor they wish in addition to find in him the solution of many difficulties of which he says nothing and in regard to which he possibly had no thought at all

Pascal takes a more moderate view We can profit he thinks from a lim ted respect f r the ancients Just as they made use of those discov eries which have been handed do vn to them only as a means for making new ones and this happy audacity opened the road to great things so Pascal suggests must we accept those which they found for us and follow their example by making them the means and not the end of our study and thus try to surpass them by imitating them For what would be more wrong than to treat the ancients with more caution than they did those who preceded them and to have for them this inviolable re spect which they only deserve from us be cause they did not feel a similar respect for those who had the same advantage over them?

MODERN WRITERS SEEM to conceive the law of intellectual progress by an analogy between the mind of the race and the individual mind Where Aquinas says merely that it seems nat ural to human reason to advance gradually from the imperfect to the perfect adding in the past tense that hence the imperfect teach ing of early philosophers was afterwards per fected by those who succeeded them Pascal generalizes the insight and gives it future sig nificance Not only does each man progress from day to day in the sciences but all men combined make constant progress as the uni verse ages because the same thing happens in the succeeding generations of men as in the dif ferent ages of each particular man So that the whole success on of men in the course of so many centuries should be regarded as the same man who exists al vays and learns continually

At this point Pascal applies his metaphor to effect a re ersal of the relation between the moderns and the ancients Since old age is the time of life most distant from childhood who does not realize that old age in this universal man should not be sought in the times closest to his birth but in those which are farthest away from it? Those whom we call ancients were really novices in all things and actually be longed to the childhood of man and as we have added to their knowledge the experience of the centuries wh ch followed them it is in ourselves that may be found this antiquity which we revere in others

Whether by accident or borrowing th s characteristically modern v e v of the adv n tage pro ress confers upon modernity s ex pressed in s milar langu g by Hobbes and Bacon Though I re er nce those m n of an c ent times writes Hobbes wl o either hav

written truth perspicuously or have set us in a better way to find it out for ourselves yet to the antiquity itself I think nothing due for if we will reverence age the present is the oldest

Antiquity as we call it writes Bacon is the young state of the world for those times are ancient when the world is ancient and not those we vulgarly account ancient by computing backwards so that the present time is the real antiquity

To secure a sound not specious progress in all things of the mind Bacon recommends the avoidance of two extremes the affectations of antiquity and novelty for antiquity envies new improvements and novelty is not content to add without defacing Since antiquity deserves that men should stand awhile upon it to view around which is the best way the great books of the past can lay the foundations for progress but only if they are properly read

Let great authors therefore have their due Bacon declares but so as not to defraud time which is the author of authors and the parent of truth

Chapter 72 PROPHECY

INTRODUCTION

THE name of prophet signifies throughout a great part of the western tradition an emin nce and dignity not shared by the scien tist the philosopher the statesman or even the sage The soothsayer and the seer in pagan antiq uity and the prophet of the Lord in Israel do not claim to speak from a merely human wis dom or to declare truths they have learned by inquiry or reflection Nor are their utterances concerned with the nature of things The proph et claims to know what men cannot know by any exercise of human powers He enjoys spe cial gifts He is divinely inspired He is in structed by God or has in some way been ad mitted to the secrets of the gods His knowl edge is not only of supernatural origin it deals with supernatural matters

Prophecy is more than a prediction of the future It unveils what Fate holds in store for men it foretells the course of providence In most cases the future predicted has deep moral significance express ng the pleasure or displeas ure of the gods with individuals or nations or manifesting God s justice in the rewards prom ised those who keep His commandments and the punishments awaiting those who break them The prophet s foresight discerns more than the future it discovers what men can hope for or must fear according to th ir merits not in the eyes of men but in the sight of God

This understanding of prophecy seems to be involved in the major issues which the *great* books raise about prophets For example the problem of distinguishing between *true* and false prophets goes beyond the mere truth or falsity of a prophet s utterances to the *validity* of his claim to special sources of knowledge or a supernaturally inspired understanding of dreams and visions omens and portents The false proph et is not like the mistaken scientist or ph los opher—just a person in error He is either a deceiving impostor or a self deceived victim of his own pathology

Similarly the Christian theologians who criticize the pagan cult of oracles and all forms of divination which seek to pry into divine mysteries seem to imply that the seers and soothsayers of Greece and Rome unlike the Hebrew prophets did not have the gift of prophecy The acceptance or rej ction of prophets and of ways of foreseeing what has been planned in Heaven cannot it se ms be separated from a whole system of religious be liefs In this respect prophets are like miracles Without faith both are incredible Th re be two marks writes Hobbes by which to gether not asunder a true Prophet is to be known One is the doing of miracles the other is the not teaching any other religion than that which is already established In Hobbes view that there be a religion already established among a people is the one indispensable condi tion for their reception of prophets or their ex perience of miracles

Issues concerning prophecy may therefore occur within a single religious community or be relative to differences between rel gious communities as for example the opposition between the Jewish and Christian interpreta tion of the messianic prophecies in the Old Testament Necessarily then there is an issue between the unbelievers and the religious of any faith Those who deny the exis ence of God or the gods or divine agency in the tem poral affairs of men and certainly those who deny the credentials of revelation cannot but regard prophets as misled and misleading a d those who accept prophecy as gullibl or su perstitious In the pagan tradition a philoso pher like Aristotle may however be cri val of divination and an historian like Thucydides may cast doubt on oracles without discredit

ing all other religious beliefs or being them selves atheists

Some who reject religious prophecy do not concede that man s natural desire to peer into the future need be completely balked But the secular substitutes for religious prophecy ap pear to alter the meaning of prophecy Scientific predictions of the future of the world or of life on this planet (as for example those which occur in the writings of Lucretius or Darwin) may be accompanied by attributions of moral qualities to Nature but usually they connote Nature s sublime indifference to man s welfare They are seldom if ever read as promises or threats of what man deserves to have befall him

Similarly historians turned prophets or philosophers of history who like Spengler prophesy decline and doom do not exhort men to avert disaster as do the prophets of the Old Testament Nor do those who like Hegel and Marx foresee the ultimate goal toward which events inevitably march urge men to prepare themselves for it as do the prophecies of the New Testament which speak of the second coming of Christ Secular prophecies which bespeak the inevitable operation of necessary causes are in this respect like pagan previsions of Fate At most they leave man only the illusion of free cho ce Jewish and Christian prophecy in contrast addresses man as a re sponsible agent who even when he knows something of God s will remains free to will good or evil for himself If according to the theologians divine providence or predestina tion does not abolish human freedom neither does p ophetic knowledge of the divine plan

These matters are discussed elsewhere—sec ular prophecy in the chapters on HISTORY and PROGRESS and the problem of foreknowledge and f eedom in the chapters on FATE and NECESSITY AND CONTINGENCY

IN PAGAN ANTIQUITY prophecy does not seem to be confined to me i especially appointed by the gods The gods themselves foretell the future to men When people wish to know the future they go or send emissaries to the temple at Delphi over which a goddess, the Pythoness, presides The institut on of the oracles of which Delphi is perhaps the mo t illustrious example leaves foresight in the hands of the gods for as most of the anecdotes in Herodo tus and Thucydides show only the Pythoness herself knows unequivocally the meaning of her oracular utterances

To men is left the task of interpreting what the oracle means The pagan unlike the Hebrew prophet seems to be a man of skill in penetrat ing the secrets of the gods—a skill which may itself be divinely bestowed—but he is not a man to whom the gods have spoken plainly so that he may in turn unerringly advise others No man when in his wits according to Plato attains prophetic truth and inspiration

There are passages in the Greek poets and historians which seem to suggest that the gods begrudge men too clear a vision of the future and may even on occasion mislead them or at least permit them to be misled In Aeschylus play Prometheus declares that because he gave to men gifts claimed by the gods he is bound in durance here He gave them radiant fire the mechanical arts he took from men the expectancy of Death he gave them medi cines and healing drugs Last in his o vn enu meration and in a sense most significant he en dowed men with the divine gift of foresight

I drew clear lines for divination Prome theus says and d scerned (before all others) what from dreams is sure to come to pass in waking I disclosed the mysteries of omen bringing words and pathway tokens and made plain the flight of taloned birds both of good augury and adverse I cleared the way for mortals to an art hard of d scernment and made bright and clear fire-auguries heretofore obscure and blind The chorus questions whether the power of creatures creeping for an hour shall by wisdom overpass the bounds set for their little lives by the mind of Zeus Does the wisdom of foreknowledge gained through the arts of divination give men strength to resist the will of the gods or to struggle against them?

Prometheus himself is the answer to the question The power he wields over Zeus which Zeus tries to wrest from him by bribes and threats and by the infliction of titanic pa n is the foreknowledge wh ch P ometheus possesses of the doom to befall the so i of K onos No threat of Zeus will get him to divulge its

Prometheus says because nought can surprise me who foreknow Nought in his power shall bend me to reveal whom Fate prepares to work his overthrow

A myth which Socrates relates in the *Gorgias* appears to contain a sequel to the legend as told by Aeschylus It also seems to confirm the point that foresight is a divine privilege in which men should not share lest they become too god like According to the myth Zeus in order to prevent men from evading the divine judgment says In the first place I will deprive men of the foreknowledge of death this power which they have Prometheus has already received my orders to take from them

The oracles never make the future so plain that men can act with a foreknowledge equal to that possessed by the gods but sometimes oracular utterances seem to be contrived not merely to veil the future but to lead men astray Herodotus tells the story of Miltiades who on the advice of Timo a priestess of the goddesses of the underworld acted in a way which brought him to grief When the Parians sent to Delphi to ask whether Timo should be punished for this the Pythoness forbade them saying Timo was not at fault twas decreed that Miltiades should come to an unhappy end and she was sent to lure him to his destruction

There is also the story told by Thucydides of Cylon who inquiring at Delphi was told to seize the Acropolis of Athens on the grand festival of Zeus This too turned into a disastrous misadventure apparently because as Thucydides observes whether the grand festival that was meant was in Attica or elsewhere was a question he never thought of and which the oracle did not offer to solve

For the most part however the calamities which befall men who seek guidance from the oracle seem to be due to their own misinterpretation of the Delphic deliverance itself always admittedly difficult to understand Herodotus and Thucydides abound with such stories and also with instances in which the same oracular statement is given conflicting interpretations one of which must be wrong Nevertheless Herodotus declares himself unwilling to say that there is no truth in prophecies and he is certainly not willing to question those which speak with clearness Giving an example of a clear prediction he adds When I look to this and perceive how clearly Bacis spoke I neither venture myself to say anything against prophecies nor do I approve of others impugning them

Thucydides appears to take a contrary view He singles out one example as an instance of faith in oracles being for once justified by the event He puts into the speech of the Athenians at the Melian Conference the warning not to be like the vulgar who abandoning such security as human means may still afford when visible hopes fail them in extremity turn to invisible to prophecies and oracles and other such inventions that delude men with hopes to their destruction

The problem of the reliability of prophecies, and of the faith or credulity of those who rely upon them applies not only to oracles but also to dreams or visions and to omens and portents of all sorts Two stories about Croesus told by Herodotus show that oracles and dreams can be equally ambiguous and are equally liable to misinterpretation Croesus dreamed that his son Atys would die by the blow of an iron weapon Subsequently when Atys wished to go boar hunting with Adrastus he persuaded Croesus that the dream could not have been a warning against this undertaking because a boar does not have hands to strike with nor does it wield iron weapons But during the hunt Atys was killed by the spear which Adrastus intended for the boar

On another occasion Croesus inquired of Delphi how long his kingdom would last The Pythoness answered in effect until a mule is monarch in Media Thus not only pleased him because it seemed incredible to him that a mule should ever become king of the Medes but also gave him confidence when he engaged in war with the Medes and Persians led by Cyrus The war ended in his defeat and capture but according to Herodotus he had no right to complain of the oracle because he had misunderstood the answer which had been given him about the mule Cyrus was that mule for the parents of Cyrus were of different races and of different kinds —his mother a Median princess his father a Persian subject

The attitude of the ancients toward these

various instruments of prophecy or divination does not seem to be consistent or constant Herodotus reports at one place how Xerxes despising the omens carried out his plans against their forebodings and at another how an eclipse of the moon being interpreted as of good omen rejoiced Xerxes who thus in structed proceeded on his way with great gladness of heart And again when Xerxes re ports to Artabanus the advice—concerning his war against the Greeks—which he received from a dream apparition Artabanus scoffs say ing Such things my son have of truth noth ing divine in them Whatever a man has been thinking of during the day is wont to hover round him in the visions of his dreams at ni ht But when Artabanus himself experi ences the same apparition which had occurred to Xerxes in his dream and in addition to giving the same advice the vision threatens him Artabanus changes his mind about dreams and reverses his policy with regard to the expedition a ainst Greece

As to the divination which takes place in sleep and is said to be based on dreams Aristotle writes we cannot lightly either dis miss it with contempt or give it implicit con fidence Nevertheless he himself seems to con clude that most so called prophetic dreams are to be classed as mere coincidences and that dreams are not sent by God nor are they de signed for this purpose *i e* foretelling the future One proof that they are not sent by God is in his opinion the fact that the persons having them are not the best and wisest but merely commonplace persons The fact that the power of foreseeing the future and of having vivid dreams is found in persons of in ferior type implies that God does not send them

THE CHRISTIAN THEOLOGIANS d stinguishing between prophecy and divination condemn the latter as a kind of presumption or impiety Though their criticism seems to be directed especially against astrology it applies to the in terpretat on of terrestrial as well as celestial s gns Augustine refers to the lying divina tions and impious dotages of the astrologers and Aquinas explains how the a trologers are able to foretell things in a general way without attributing to them any genuinely prophetic power

In his consideration of the difference between true and false religion Hobbes goes further than the theologians in condemning the in numerable other superstitious ways of divina tion such as the ambiguous or senseless an swers of the priests at Delphi Delos Ammon and other famous oracles or the prediction of witches that pretended conference with the dead which is called necromancy conjuring and witchcraft and is but juggling and con federate knavery or in general the recourse to omens portents and dreams for purposes of prognostication

That the things Hobbes calls superstitious are not confined to pagan antiquity is manifest in Shakespeare s *Macbeth* The witches and the omens there are like the soothsayers and the portents in *Julius Caesar* and Macbeth s mis understanding of til Birnam Forest come to Dunsinane is as fatal as Croesus reliance on until a mule is monarch in Media

In one other respect pagan and Christian cultures seem to exhibit a certain parallelism with regard to the belief in supernatural fore knowledge The spirits of the departed in the *Odyssey* and the *Aeneid* are able to inform the visitor to the underworld of coming events on earth They speak plainly and with perfect prescience The veil which hides the future from mortal eyes has been lifted So too the damned souls and the blessed foretell future things to Dante no less accurately though less extensively than in *Paradise Lost* the arch angel Michael unfolds to Adam the whole fu ture history of mankind

But so far as the foreknowledge of mortal men is concerned the Hebrew p ophets seem to be unique Unlike pagan d viners or sooth sayers they do not probe the future in order to help men anticipate the turns of fortune or the lines of fate They do not have to employ arts or devices for penetrating divine secrets God speaks to them directly and through them to the Chosen People For the most part their prophetic speeches unlike those of the oracles seem to be unamb guous At lea t the intention se ms to be to re eal not to conceal God s plan on such matt s a He Himself wishes men to foresee the course of providence

Where pagan prognosticators may claim to be divinely inspired in the sense of having special powers of interpretation the Hebrew prophets speak from a different kind of super natural inspiration They are the vessels through which the Lord Himself speaks They are interpreters only in that they make known to others what God has made known to them

The content of the divine communication is seldom exclusively a foretelling of the future It is often accompanied by instruction concerning the actions to be performed by the Jewish peo ple—the direction of their conduct toward the Promised Land or the rebuilding of the Temple Sometimes when the prophecy is one of doom rather than of hope as in the case of the de struction of Jerusalem the Babylonian captiv ity or the dispersion of Israel the prediction of the future is accompanied by moral instruction of another sort—the lessons of the Law which the Jews have forsaken meriting thereby the punishments the prophets foresee

Mere prognostication does not seem to be the chief purpose of Hebrew prophecy Just as the Covenant which God makes with Abraham Isaac and Jacob consecrates the Jewish people to a special mission just as the Law which God hands down through Moses sets them apart from the Gentiles and prescribes for them the way of righteousness and sanctity so the reve lations of God s providence throu_h the proph ets tend to remind the Chosen People of the meaning of the Covenant and the Law as well as to d sclose their destiny as a nation

The prophets speak not only of the future but of the present and the past They are di vinely appointed teachers no less than the patriarchs and Moses Yet they may rank below Moses (who is sometimes also regarded as a prophet) by reason of the manner in which they are addressed by God As Hobbes points out God himself in express words declareth that to other prophets he spake in dreams and vi sions but to his servant Moses in such manner as a man speaketh to his friend —face to face

The content of Hebrew prophecy in short seems to be continuous with the rest of God s revelation of Himself to His Chosen People The difference between the prophets as the in struments of God s teaching and the pagan philosophers as merely human teachers seems to Augustine plainly shown by the a reement of the prophets with one another and by their continuity with Moses and the patriarchs whereas Augustine can find nothing but dis greement and dissension among even the best teachers of the pagans Among them false teachers or prophets seem to be accorded the same recognition and to attract the same fol lowing as true

But that nation Augustine writes that people that city that republic these Israelites, to whom the oracles of God were entrusted by no means confounded with similar licence false prophets with the true prophets but, agreeing together and differing in nothing acknowledged and upheld the authentic au thors of their sacred books These were th ir philosophers these were their sa es divines, prophets and teachers of probity and pi ty Whoever was wise and lived according to them was wise and lived not according to men but according to God who hath spoken to them

Hobbes also conceives the prophets of the Old Testament as more than foretellers of the future The name of prophet he writes sig nifies in Scripture sometimes *prolocutor* that is he that speaketh from God to man or from man to God and sometimes *predictor* or a fore teller of things to come In addition to their being divinely appointed teachers the proph ets according to Hobbes seem to perform a political function They check the power of the kings or seek to awaken their consciences to the dictates of justice and mercy Throu h the whole history of the kings as well of Judah as of Israel there were prophets that always con trolled the kings for transgressing the religion and sometimes also for errors of state

A secular view of the Hebrew prophets seems to give prominence to their political role in the theocratic community of the Jews Comparing the Jewish state with other sacerdotal societies, Mill observes that neither their kings nor their priests ever obtained as in those other coun tries the exclusive moulding of their character Their religion gave existence to an inestima bly precious unorganized institution—the Or der (if it may be so termed) of the Prophets Under the protection generally though not al ways effectual of their sacred character the Prophets were a power in the nation often

more than a match for kings and priests and kept up in that little corner of the earth the antagonism of influences which is the only real security for continued progress

AS THERE IS A BODY of prophetic doctrine in the Old Testament so the religion of the Gospels contains a number of prophetic beliefs peculiar to Christian doctrine Such for example is the prophecy of the second coming of Christ the prophecy of the Last Judgment on that occasion and the prophecy of a final conflagration to cleanse the world which will precede the resurrection of the body as that in turn precedes the general judgment of souls

Aquinas discusses the various signs which will foretell the imminence of these events He also raises the question whether the time of the end of the world and of the resurrection can be known exactly On this he agrees with Augustine that that time is hidden from men It cannot be calculated by natural reason nor is it revealed Of that day and hour it is written in Matthew no one knoweth no not the angels of heaven When the apostles asked Christ about His second coming He answered according to Saint Paul It is not for you to know the times or moments which the Father hath put in His own power

What Christ refused to tell the apostles Aquinas adds, He will not reveal to others Wherefore all those who have been misled to reckon the aforesaid time have so far proved to be untruthful for some as Augustine says stated from our Lord s ascension to His last coming 400 years would elapse others 500 others 1 000 The falseness of these calculators is evident as will likewise be the falseness of those who even now cease not to calculate

The single greatest prophecy in the Judaeo-Christian tradition is perhaps the messianic prophecy—the foretelling of a Messiah or of a messianic age The prediction of a Messiah or Saviour who shall be born of the house of David and shall be king of the Jews runs throughout the prophetic books of the Old Testament though with different degrees of explicitness and varying imagery in Daniel and Jeremiah in Isaiah and Ezekiel

The Lord himself shall give you a sign says Isaiah Behold a virgin shall conceive and bear a son and shall call his name Immanuel For unto us a child is born unto us a son is given Isaiah goes on and the government shall be upon his shoulder and his name shall be called Wonderful Counsellor The mighty God The Everlasting Father The Prince of Peace Of the increase of his government and peace there shall be no end upon the throne of David and upon his kingdom to order it and to establish it with justice from henceforth even for ever And Jeremiah tells his people Behold the days come saith the Lord that I will raise unto David a righteous Branch and a King shall reign and prosper and shall execute judgment and justice in the earth In his days Judah shall be saved and Israel shall dwell safely

Two of the great issues between the Jewish and Christian faiths concern these messianic prophecies in the Old Testament One arises from opposite interpretations of the event predicted—a messianic age in which the kingdom of the Jews will be established on earth in perpetual righteousness and glory or the coming to earth of God s only begotten son incarnate in human form for the salvation of all mankind The other arises from opposite answers to the question whether the prediction—on either interpretation—has been fulfilled

It is of course the Christian view that the prophets foretold the coming of Christ and that their prophecy has been fulfilled But more than that Christian apologists and theologians seem to make the fulfillment of Hebrew prophecies interpreted as foreshadowing the truths of the Christian religion a source of verification for these truths

The difference between Jesus Christ and Mahomet according to Pascal is that Mahomet was not foretold Jesus Christ was foretold I see many contradictory religions and consequently all false save one he writes Each wants to be believed on its own authority and threatens unbelievers I do not therefore believe them Everyone can say this everyone can call himself a prophet But I see the Christian religion wherein prophecies are fulfilled and that is what everyone cannot do

And in another place Pascal declares that the prophecies are the strongest proof of Jesus Christ If one man alone had made a book of predictions about Jesus Christ as to the time

and manner and Jesus Christ had come in conformity to these prophecies this fact would have infinite weight But there is much more here Here *is a succession of* men during four thousand years who consequently and without variation come one after another to foretell this same event

Centuries earlier Augustine writes in a similar vein The Hebrew people as a whole are chosen to perform this prophetic function—to foretell sometimes through men who understood what they spake and sometimes through men who understood not all that has transpired since the advent of Christ until now and all that will transpire Not only the explicit prophecies which are contained in words, but all the rituals and ceremonies the offices and institutions of the Jewish religion prefigure Christianity signifying and fore-announcing those things which we who believe in Jesus Christ unto eternal life believe to have been fulfilled or behold in process of fulfillment or confidently believe shall yet be fulfilled

Chapter 73 PRUDENCE

INTRODUCTION

Of the qualities or virtues attributed to the intellect prudence seems to be least concerned with knowledge and most concerned with action When we call a man a scientist or an artist or praise the clarity of his understanding we imply only that he has a certain kind of knowledge We admire his mind but we do not necessarily admire him as a man We may not even know what kind of man he is or what kind of life he leads It is significant that our language does not contain a noun like scientist or artist to describe the man who possesses prudence We must use the adjective and speak of a prudent man which seems to suggest that prudence belongs to the whole man rather than just to his mind

Prudence seems to be almost as much a moral as an intellectual quality We would hardly call a man prudent without knowing his manner of life Whether he behaved temperately would probably be much more relevant to our judgment of his prudence than whether he had a cultivated mind The extent of his education or the depth of his learning might not affect our judgment at all but we probably would consider whether he was old enough to have learned anything from experience and whether he had actually profited from experience to become wise

These observations not only express the ordinary sense of the word prudence but also give a summary indication of the idea for which that word stands in the great books Like other fundamental traits of mind or character prudence is considered by the poets and historians in terms of precept and example For the definition of the term or for an analysis of its relation to other fundamental ideas such as virtue and happiness desire and duty one must go to the great works of moral and political theory or of theology

Even there however the conception of prudence is used more frequently than it is expounded Plato Aristotle Aquinas Hobbes and Kant seem to be the exceptions and of these only Aristotle and Aquinas offer an extended analysis—Aristotle in his book on intellectual virtue in the *Ethics* Aquinas in certain questions of his Treatise on Habits in the *Summa Theologica* but more extensively in his Treatise on Prudence (see the questions from the *Summa Theologica* cited in the list of Additional Readings)

THAT PRUDENCE IS NOT knowledge in the ordinary sense of the term—that it is a product of experience and a possession of reason which unlike science or art cannot be expressed in propositions—seems to be clearly implied by Hobbes When the thoughts of a man that has a design in hand running over a multitude of things observes how they conduce to that design or what design they may conduce to if his observations are such as are not easy or usual this wit of his is called Prudence and depends on much experience and memory of the like things and their consequences heretofore

Whereas science can achieve some certainty the judgments of prudence are according to Hobbes all uncertain because to observe by experience and remember all circumstances that may alter the success is impossible It is the opposition between experience and science which seems to lead Hobbes to distinguish prudence from wisdom As much experience is prudence so is much science sapience For though we usually have one name of wisdom for them both yet the Latins did always distinguish between *prudentia* and *sapientia* ascribing the former to experience the latter to science

The Greeks also had two words—*phronesis*

and *sophia*—both of which are sometimes translated in English by wisdom But Aristotle like Hobbes insists upon the distinction between the wisdom which is the ultimate fruit of the speculative sciences or philosophy and the wisdom which belongs to the sphere of moral and political action Wishing to preserve Aristotle s sense that *phronesis* and *sophia* have something in common which deserves the eulogistic connotation of wisdom his translators usually render these words in English by the phrases practical wisdom or political wisdom (for *phronesis*) and speculative wisdom *or philosophical wisdom (for sophia)* The English rendering of Aquinas on the other hand usually translates his *prudentia* by prudence and his *sapientia* by wisdom

Whether it is permissible to use prudence and practical wisdom as synonyms may be more than a question of verbal equivalence for there is a fundamental issue in theory concerning the unity of wisdom on which Plato differs from both Aristotle and Aquinas The question about the relation of knowledge and virtue may be differently answered according to the view of wisdom which denies its division into speculative and practical and according to the view which conceives the possibility that a man may be wise in one way without being wise in the other In the language of Aquinas a man may have acquired wisdom through science and understanding without having the moral character *of a prudent man*

That practical wisdom is not scientific knowledge is evident Aristotle declares This is confirmed he adds by the fact that while young men become geometricians and mathematicians and wise in matters like these it is thought that a young man of practical wisdom cannot *be found The reason is that such wisdom* is concerned not only with universals but with particulars which become familiar from experience but a young man has no experience for it is length of time that gives experience

Hobbes and Aristotle seem to agree that experience is important for the development of prudence or practical wisdom precisely because it is practical and practice is concerned with particulars. But though both also agree that this explains the distinction between prudence and scientific knowledge—which is concerned not with action but with the nature of things—Aristotle alone raises a further question about the distinction between practical wisdom and art

In making something the artist also deals with particulars In this sense art is also practical But according to Aristotle the word productive should be used in distinction from practical to signify the difference between making and doing—two kinds of human activity which though alike as compared with scientific knowing represent knowledge differently applied The knowledge which the artist possesses can furthermore be formulated in a set of rules An individual can acquire the skill of an art by practicing according to its rules. What a man knows when he is prudent seems to be much less capable of being communicated by precept or rule What he knows is how to deliberate or calculate well about things to be done

This in Aristotle s view marks prudence [illegible] from all other virtues That prudence is a [illegible] ity of mind seems to follow from the fact [illegible] it involves deliberation a kind of [illegible] about variable and contingent [illegible] the same sort which belong to the [illegible] opinion That prudence is also a moral [illegible] an aspect of character seems to follow [illegible] from Aristotle s statement that [illegible] deliberation about the means to any [illegible] but only about those which [illegible] *good life in general*

conceives [illegible]

to God When the event answers expectations the prediction is attributed to prudence yet human foresight being fallible it is but presumption For the foresight of things to come which is Providence belongs only to him by whose will they are to come Aquinas gives a quite different reason for saying that prudence or providence may suitably be attributed to God It is that the ordering of things toward their ultimate end is the chief part of prudence to which two other parts are directed —namely remembrance of the past and understanding of the present inasmuch from the remembrance of what is past and the understanding of what is present we gather how to provide for the future

Prudence is sometimes described not as a virtue of the mind or even as the power of foresight but as a temperamental trait an emotional disposition It is associated with timidity or caution in those who are fearful of risks or unwilling to take chances It is in this sense that Bacon seems to oppose hopefulness to prudence which is diffident upon principle and in all human matters augurs the worst The cautiousness of the over deliberate man may involve thought as well as fear Hamlet thinks too much and on too many sides of every action His action being sicklied o er by the pale cast of thought he is irresolute He laments his misuse of reason Whether it be bestial oblivion or some craven scruple of thinking too precisely on the event—a thought which quartered hath but one part wisdom and ever three parts coward—I do not know why yet I live to say this thing s to do since I have cause and will and strength and means to do it

When prudence is conceived as excessive caution its opposite is usually described as rashness precipitateness or impetuosity Thucydides portrays these opposites in the persons of Nicias and Alcibiades Their speeches to the Athenian assembly on the question of the Sicilian expedition do not merely present an opposition of reasons for and against the undertaking but also represent an opposition of types of human character Both come to grief Nicias the overcautious leader of the expedition who earns a not inevitable defeat by his ever-delaying tactics and Alcibiades who does not stop at treachery or treason when the moment seems ripe for action which if quickly taken may succeed

Aristotle and Aquinas would use such facts to argue against what in their view is the misconception of the prudent man as the opposite of the impetuous The prudent man in their opinion does not stand at the other extreme of undue caution In their theory of the virtues as means between extremes of excess and defect prudence like courage or temperance represents a mean consisting in neither too much nor too little As cowardice and foolhardiness are the opposite vices of too much and too little fear—and as both are opposed to the mean of courage which involves a moderation of fear—so excessive caution and impetuosity are the vices opposed to prudence as well as to each other

Nor are prudence and imprudence simply matters of temperament Men may differ in their temperamental dispositions but according to Aristotle and Aquinas, these are not to be confused with virtues and vices One man may be by nature more fearful or fearless than another but regardless of these differences in emotional endowment either may become courageous by forming the habit of controlling fear for the right reasons So too, one man may be naturally more impulsive or more circumspect than another but either can acquire prudence through learning to take sufficient counsel and to deliberate enough before action, while also forming the habit of resolving thought into action by reaching decisions and commanding their execution Failing to satisfy these conditions of prudence either may develop the vices of imprudence becoming like Hamlet or Nicias irresolute or like Alcibiades impatient of counsel or ill advised lacking care in deliberation and soundness in judgment

THE CONCEPTION OF prudence as itself the extreme of caution whether temperamental or habitual is not the only challenge to the Aristotelian theory of prudence as a virtue Other moralists especially those who take a different view of virtue generally do not seem to look upon prudence as wholly admirable Even when they do not condemn prudence as an indisposition to act promptly or decisively

enough they seem to give prudent deliberation the invidious connotation of cold and selfish calculation

A suggestion of this appears in Mill s contrast between duties to ourselves and duties to others wherein he remarks that the term duty to oneself when it means anything more than prudence means self respect and self development It would seem to be implied that prudence means something less—something more selfish—than a proper and justifiable self interest the violation of which involves a breach of duty to others for whose sake the individual is bound to have care for himself

Kant more explicitly than Mill associates prudence with exped ency and self seeking and separates it from action in accordance with duty under the categorical imperative of the moral law Prudence has meaning only in relation to a hypothetical imperative which expresses the practical necessity of an action as a means to the advancement of happiness Granted that a man seeks his individual happiness then skill in the choice of means to his own greatest well being may be called *prudence* Consequently the imperative which refers to the choice of means to one s happiness i e the precept of prudence is still always hypothetical the action is not commanded absolutely but only as a means to another purpose or as Kant says elsewhere the maxim of self love (prudence) only *advises* the law of morality *commands* Furthermore he holds that what *duty* is is plain of itself to everyone but what it is to bring true durable advantage such as will extend to the whole of one s existence is always veiled in impenetrable obscurity and much prudence is required to adapt the practical rule founded on it to the ends of life even tolerably by making exceptions

In terms of Kant s division of the imperatives of conduct into the pragmat c and the moral according as they refer to welfare and happiness or duty and law prudence is merely pragmatic It does not belong to morality The pragmatic imperative of prudence is more like the technical imperative of art which is also conditional and concerned with determining means to an end—in this case the thin to be produced by skill If it were only equally easy to give a definite conception of happiness the imperatives of prudence would correspond exactly with those of skill

As Kant sees it the sole business of reason in the moral philosophy of prudence is to bring about a union of all the ends which are aimed at by our inclinations into one ultimate end—that of *happiness* and to show the agreement which should exist among the means of attaining that end In this sphere accordingly reason cannot present to us any more than *pragmatical* laws of free action for our guidance towards the aims set up by the senses and is incompetent to give us the laws which are pure and determined completely *a priori* Hence the precepts of prudence are used by reason only as counsels and by way of counterpoise against seductions to an opposite course

The issue between Kant and Aristotle (or Aquinas) with respect to prudence thus appears to be part of the larger issue between them on the fundamental principles of morality discussed in the chapters on DUTY and HAPPINESS In Kant s view Aristotle and Aquinas no less than Mill are pragmatists rather than moralists They are all utilitarians in the sense that they regard happiness as the first principle of human conduct and concern themselves with the ordering of means to this end Since the consideration of means ne essarily involves the weighing of alternatives as more or less expedient prudence becomes indispensable to the pursuit of happiness The choice of the best means is second in importance only to the election of the right end

Kant admits that those who live for happiness require a great deal of prudence in order to adapt practical rules to variable circumstances and to make the proper exceptions in applying them None is required by those who live according to the moral law The moral law commands the most punctual obedience from everyone it must therefore not be so difficult to judge what it requires to be done that the commonest unpracticed understanding even without worldly prudence should fail to apply it rightly That the principle of *private* happiness is the direct oppo t of the principle of moral ty Kant seems to th nk is evident from the questionable worth of prudence for a man must hav a different crit

tion when he is compelled to say to himself I am a *worthless* fellow though I have filled my purse and when he approves himself and says I am a *prudent* man for I have enriched my treasure

Kant does not limit his criticism of prudence as pragmatic—or practical rather than moral—to the fact that it serves what h calls private happiness It may serve the public welfare A history is composed pragmatically he writes when it teaches *prudence i e* instructs the world how it can provide for its interests better But he also distinguishes between worldly and private prudence The former is a man s ability to influence others so as to use them for his own purposes The latter is the sagacity to combine all these purposes for his own lasting benefit Nevertheless the pru dence which aims at individual happiness is primary for when a man is prudent in the former sense but not in the latter we might better say of him that he is clever and cunning but on the whole imprudent

THOSE WHO TAKE THE view that happiness is the first principle of morality would still agree with Kant that the man who is skillful in exer cising an influence over other men so as to *use* them for his own purposes is clever or cunning rather than prudent Hobbes for example says that if you permit to prudence the use of un just or dishonest means you have that Crooked Wisdom which is called Craft Aristotle goes even further in his insistence that it is impossible to be practically wise without being good or as the same point is made in the language of Aquinas one cannot have prudence unless one has the moral virtues since prudence is right reason about things to be done to which end man is rightly disposed by moral virtue

To be able to do the things that tend to wards the mark we have set before ourselves is according to Aristotle to be clever If the mark be noble the cleverness is laudable but if the mark be bad the cleverness is mere smartness Hence the man of prudence has a certain cleverness but the clever man who is merely smart cannot be called practically wise By this criterion the cle er th ef who plans and executes a successful robbery the shrewd busi nessman who without regard to justice cal culates well how to maximize his profits or Machiavelli s prince who exercises cunnin to get or keep his power exhibits not prudence but its counterfeits In some cases the clever ness or shrewdness may simulate prudence without involving the knavery of craft or cunning Some men have what Aquinas con ceives as artistic (or technical) rather than moral prudence Those who are good coun sellors in matters of warfare or seamanship are said to be prudent officers or pilots but not simply prudent Only those are simply p dent who give good counsel about all the concerns of life

Aristotle and Aquinas make the relatio be tween prudence and moral virtue reciprocal The moral virtues depend for their forma and endurance as much upon pruder as prudence depends upon them Virtu makes us aim at the right end Aristotle writes and practi al wisdom makes us take the ght means The rightness of the means re uires not merely that they be adapted to an end but that the end itself be right The ri ht end can not be achieved unless the means to it be ri ht ly chosen Hence no skill of mind in del berat ing about and choosing means is truly the intellectual virtue of prudence unless the man who habitually calculates well is also habitually inclined by the moral virtues to choose things for the right end whether that be happiness or the common good of society

Conversely the moral virtues depend upon prudence because in Aristotle s view they are formed by the making of right choices His definition of moral virtue names prudence a an indispensable cause Since the mean between extremes in which the virtues consist is in most cases subjective or relative to the ind vidual it cannot be determined by objective measurements Reason must determine it by a prudent consideration of the relevant circum stances

The interdependence of prudence and the moral virtues seems to be the basis for both Aristotle and Aquinas of the insight that it is impossible to have one moral virtue without having all On this basis Aristotle says we can refute the dialectical argument that the virtues exist in separation from one another

As no moral virtue can exist apart from prac tical wisdom so with it all must be present

Aquinas mentions another intellectual virtue as indispensable to the moral virtues namely the virtue of understanding which consists in knowing the first principles in practical as well as speculative matters The first principles of the practical reason (i e the precepts of the natural law) underlie prudence as well as the moral virtues Just as sound reasoning in specu lative matters proceeds from naturally known principles so also does prudence which is right reason about things to be done Never theless though prudence and the moral virtues depend upon it Aquinas does not include understanding—as he does not include art science and wisdom—in his enumeration of the four cardinal virtues cardinal in the sense of being the virtues indispensable to a good human life

THESE MATTERS especially the interconnection of the virtues and the theory of the cardinal virtues are discussed in the chapter on VIRTUE The problem of the relative worth of the moral and the intellectual virtues is also considered there and in the chapter on WISDOM where the contributions to happiness of prudence and wisdom—or of practical and speculative wis dom—are specifically compared

Here there remains to be considered the Socratic conception of the relation between knowledge and virtue for there seems to be an issue between his theory of this matter and the foregoing view of the relation between pru dence and the moral virtues

In the *Meno* Socrates argues that whatever a man desires or chooses he either knows or deems to be good The man who chooses some th ng evil for himself does not do so knowingly but only through the mistake of deeming that which is in fact evil to be advantageous or good Except for such mistakes no man says Socrates wills or chooses anything evil Apart from error or ignorance evil is never voluntarily chosen Hence if virtue consists in willing or desiring things which are good and in having the po ver to ga n them it would seem to follow that knowledge of the good is closely related to its practice

Subsequently Socrates suggests that if there be any sort of good which is distinct from knowledge virtue may be that good but if knowledge embraces all good then we shall be right in thinking that virtue is knowledge To test these hypotheses he proceeds to con sider the various things which—whether or not they are the same as virtue—are like virtue in being advantageous to men None of these things such as courage or temperance seems to profit men unless accompanied by what in English translations is sometimes called wis dom and sometimes prudence

Socrates points out that everything the soul attempts when under the guidance of wisdom —or prudence— ends in happiness but in the opposite when under the guidance of folly —or imprudence If then he says virtue is a quality of the soul and if it be of necessity always advantageous then virtue must be wisdom or prudence since none of the things of the soul are either advantageous or hurtful in themselves but they are all made advantageous or hurtful by the addition to them of prudence or imprudence —wisdom or folly From this says Socrates we can con clude that prudence is virtue either the whole of virtue or some part of it at least —or as this is sometimes translated virtue is either wholly or partly wisdom

In the light of his own view that all the moral virtues depend on practical wisdom Aristotle criticizes the Socratic position Socrates in one respect was on the right track while in another he went astray In thinking that all the virtues were forms of practical wisdom he was wrong but in saying that they implied practical wis dom he was right Socrates thought the virtues were rules or rational principles while we think they involve a rational prin ciple Similarly in considering the question whether there can be moral without intellec tual virtue Aquinas writes Although virtue be not right reason as Socrates held yet not only is it *according to right reason* insofar as it inclines a man to do that which is in accord with right reason as the Platonists maintained but it also needs to be *joined with right reason* as Aristotle declares

Aquinas furthermore interprets the opinion that every virtue is a kind of prudence which he attributes to Socrates as meaning

that when a man is in possession of knowledge he cannot sin and that everyone who sins does so through ignorance This he says is based on a false supposition because the appetitive faculty obeys the reason not blindly but with a certain power of opposition Nevertheless there is some truth in the saying of Socrates that so long as a man is in possession of knowledge he does not sin provided that this knowledge involves the use of reason in the individual act of choice

Whether those who criticize the position of Socrates accurately perceive his intention and state the issue fairly are problems of interpretation as difficult as the question of where in this matter the truth lies If Socrates is saying that a man will do good if he knows the good what sort of knowledge is implied—knowledge of the good in general or knowledge of what is good in a particular case? Do both types of knowledge of the good lead as readily or surely to good or virtuous action?

Whether or not in addition to knowledge a good will or right desire is essential it may be held that prudence is required to apply moral principles—aiming at the good in general—to particular cases There exists no moral system writes Mill under which there do not arise unequivocal cases of conflicting obligation These are the real difficulties the knotty points both in the theory of ethics and in the conscientious guidance of personal conduct They are overcome practically with great or less success according to the intellect and virtue of the individual Mill seems to imply that both prudence and virtue are essential to good action on the level of particulars and that without them the kind of knowledge which is expressed in moral principles does not necessarily lead a man to act well

One other problem of interpretation must be mentioned It occurs with respect to Aristotle s statement concerning diverse modes of prudence

Political wisdom and practical wisdom are the same state of mind he writes but their essence is not the same Of the wisdom concerned with the city the practical wisdom which plays a controlling part is legislative wisdom while that which is related to this as particulars to their universal is known by the general name of political wisdom Practical wisdom also is identified especially with that form of it which is concerned with the individual man and this is known by the general name practical wisdom Of the other kinds, one is called domestic another legislative a third political and of this last one part is called deliberative and the other judicial

Does this mean that skill of mind in determining the best means to an end is different according to differences in the end—whether the happiness of an individual or the common good of a society? Does it mean furthermore, that the prudence involved in managing a household is different from the prudence concerned with political affairs and that in the state the prudence of the ruler (prince or statesman) is different from the prudence of the ruled (subject or citizen) because the one moves on the level of general laws the other on the level of particular acts in compliance with law? Within the sphere of jurisprudence or the prudence of laws is the prudence of the legislator or lawmaker different from the prudence of the judge who applies the law?

In his Treatise on Prudence Aquinas answers these questions affirmatively He distinguishes between private domestic and political prudence and within the political sphere places special emphasis upon what he calls reignative prudence the sort of prudence Dante calls a kingly prudence which sets the prince apart from ordinary men. Hobbes on the other hand asserts that to govern well a family and a kingdom are not different degrees of prudence but different sorts of business no more than to draw a picture in little or as great or greater than life are different degrees of art

This issue is intimately connected with the problem of the forms of government If only a few men are fitted by nature to acquire the special mode of prudence which is reignative or legislative would not government by the few or by the one seem to be naturally best? If however in a republic those who are citizens rule and are ruled in turn should not each citizen have the prudence requisite for both tasks whether it be the same or different? Finally if the democratic theory is that all men

are capable of being citizens—though not all perhaps are equally eligible for the highest public offices—must not political prudence be conceived as attainable by all men?

The question remains open whether those who deserve the highest magistracies have a special mode of reignative prudence or merely a higher degree of the same prudence by which they govern their private lives and their domestic establishments or as Hobbes suggests have other abilities whereby they can apply the same prudence to a different kind of business

OUTLINE OF TOPICS

REFERENCES

To find the passages cited use the numbers in heavy type which are the volume and page numbers of the pass ges referred to For example in **4** HOMER *Iliad* BK II [265 283] **12d** the number **4** is the number of the volume in the set the number **12d** indicates that the pas sage is in section d of page 12

PAGE S CTIONS When the text is printed in one column the letters a and b refer to the upper and lo ver halves of the page For example in **53** JAMES *P ychology* **116a 119b** the passage begins in the upper half of page 116 and ends in the lower half of page 119 When the text is printed n two column the letters a and b refer to the upper and lower halves of the left hand side of the page the letters c and d to the upper and lower halves of the right hand side of the page Fo example in **7** PLATO *Sympos um* **163b 164c** the passage begins in the lo er half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164

AUTHOR S DIVISIONS One or more of the main divisions of a work (such as P RT BK CH S T) are sometimes included in the reference line numbers in brackets are given in cer tain cases *e g Il ad* BK II [265 83] **12d**

BIBL R FER NCES The references are to book chapter and verse When the Kin J mes and Douay versions differ in title of books or in the numberin of chapters or verses the King James version is c ted fir t and the Douav indicated by a *(D)* follows *e g* OLD TESTA MENT *N hem ah* 7 45—*(D) II Esdras* 7 46

S IBOLS The abbreviation esp calls the reader s attention to one or more especially relev nt parts of a whole reference passim signifies that the topic is discussed intermit tently rathe than continuously in the work or passage cited

For addit onal information concernin the style of the references see the Explanation of Referen e Style for gene al guidance in the use of *The Great Ideas* consult the Preface

Chapter 74 PUNISHMENT

INTRODUCTION

THE problem of punishment divides into a number of questions In what does punishment consist? What purpose should punishment serve or what should be its principle or reason? Who has the authority to punish and under what conditions shall this authority be exercised? Who shall be punished and who shall be exempt from punishment? What are the forms or kinds of punishment? Are any of these reprehensible either in principle or for their consequences? Should there be a proportion between the severity of punishment and the gravity of the offense? Can a person punish himself? Do men desire to be punished?

These questions apply though not with equal emphasis to the three major types of wrongdoing in relation to which men discuss the nature and the need of punishment its justice or its expediency Punishment is traditionally considered in relation to vice to crime and to sin According to the type of wrongdoing being considered the punitive agent may be the wrongful individual himself or his family his state his church or God

The lines which separate these areas of the problem of punishment cannot be sharply drawn in all cases for as certain acts simultaneously violate the moral the civil and the divine law they may also cause a person to be simultaneously subject to punishment from diverse sources The wrong or injury which punishment is supposed to redress may in some cases fall under none of these headings as for example acts of war or rebellion It is sometimes questioned whether the theory of punishment remains the same when punitive steps are taken by one state against some or all the people of another or again when a government applies penalties for a rebellion engaged in by members of its own community

In this chapter we shall deal with the problem of punishment in its most general terms, for the most part considering the foregoing questions without regard to the distinction of sin crime and vice or to the differences between divine and human punishment or between punishment by the state and in the family (*i e* punishment as involved in the enforcement of law and punishment as an instrument of education or training) These more specialized topics belong to other chapters *e g* punishment as affecting the formation of character to the chapters on EDUCATION and VIRTUE AND VICE punishment as administered by parents to the chapter on FAMILY divine rewards and punishments to the chapters on IMMORTALITY and SIN

The basic ideas in terms of which any discussion of punishment proceeds are of course the subjects of the chapters on JUSTICE and LAW One other chapter—PLEASURE AND PAIN—is of peculiar relevance to the question about the nature of punishment Concerning the nature of punishment there seems to be no great difference of opinion in the tradition of western thought Punishment is generally conceived as the infliction of pain though some writers distinguish between corporeal and spiritual punishment according as the pain inflicted is the pain of sense or the pain of deprivation and loss Imprisonment for example always entails the pain of loss—the loss of freedom—but it may also carry with it the suffering of physical hardships or even tortures The torment of the damned is according to some theologians, both corporeal and spiritual—the agony of hell fire and the anguish of the soul deprived of God's love and presence

IF THERE IS LITTLE DISPUTE about the nature of punishment the opposite situation prevails concerning its purpose Why men should be

punished is one of the most controversial questions in the field of moral and political thought and in psychology and theology as well

The major opposition in the tradition of the great books is between those who think that punishment need only be inherently just and those who think it cannot be justified without reference to its utility or expediency While this debate goes on for more than twenty centuries punishments in actual practice—whether in accordance with the law or uncontrolled by it—tend generally to be severe and often fiendish or ferocious Not until Beccaria in the 18th and Bentham in the 19th century does the discussion of punishment lead to major reforms in the spirit and provisions of the penal codes But the opposite positions in the debate across the centuries are never without practical significance for penal institutions and punitive measures even when theory is not immediately reflected in practice The speculative significance of the issue is however always immediately apparent Although justice and law are more fundamental and comprehensive ideas than punishment this one problem of punishment—the question of its purpose—critically tests the meaning of anyone s theory of law and justice

It may be that the issue cannot be fairly stated in terms of *purpose* To use that word may beg the question since one of the basic positions in the controversy appears to be that punishment has no purpose in the sense of *serving some end beyond itself* or producing some desired consequence *in the future* This is the theory—shared by Kant and Hegel—that punishment should be purely retributive

According to this view the effect of the punishment upon the wrongdoer or upon others whose conduct may be affected by punishments meted out or threatened must not be taken into account at all Nothing should be sought except the preservation of the balance sheet of justice by seeing that every wrong is duly requited by a proportionate measure of punishment Nor is the requital purely retributive if it considers any person except the wrongdoer himself That punishment of the transgressor may assuage the feelings of those he has injured or even satisfy a desire for revenge should have no motivating force The only pleasure the spectacle of punishment should yield the only desire it should satisfy is that of seeing the moral law upheld We should punish only because we have under the moral law a duty to do so

Kant castigates as utilitarian every theory of punishment which directs it to the service of anything besides strict justice—such as the reformation of the criminal the deterrence of others the welfare of society or the slaking of the thirst for vengeance Juridical punishment he says can never be administered merely as a means for promoting another good either with regard to the Criminal himself or to Civil Society but must in all cases be imposed only because the individual on whom it is inflicted *has committed a Crime* The Penal Law is a Categorical Imperative and woe to him who creeps through the serpent windings of Utilitarianism to discover some advantage that may discharge him from the Justice of Punishment or even from the due measure of it

What shall determine the mode and measure of punishment? Kant answers It is just the Principle of Equality by which the pointer of the Scale of Justice is made to incline no more to one side than the other It may be rendered by saying that the undeserved evil which anyone commits on another is to be regarded as perpetrated on himself This is the Right of Retaliation (*jus talionis*) and properly understood it is the only Principle which can definitely assign both the quality and the quantity of a just penalty All other standards are wavering and uncertain and on account of other considerations involved in them they contain no principle conformable to the sentence of pure and strict Justice

RETRIBUTIVE PUNISHMENT or retaliation seems to express the principle of justice or fairness in exchange The Mosaic injunction that thou shalt give life for life eye for eye tooth for tooth burning for burning wound for wound stripe for stripe occurs in the context of other passages which declare the compensation in goods which an injured party shall receive for the loss of or damage to his chattel But it is also accompanied by ordinances which impose the death penalty for wrongs other than the taking of a life

You have heard Christ declares in the Sermon on the Mount that it hath been said An eye for an eye and a tooth for a tooth But I say unto you That ye shall resist not evil but whosoever shall smite thee on thy right cheek turn to him the other also And if any man will sue thee at the law and take away thy coat let him have thy cloak also This passage has sometimes been taken to mean that all punishment is simply vengeance and that instead of returning injury for injury the Christian should love his enemies and forgive them If you think someone has wronged you Princess Mary says to Prince Andrew in *War and Peace* forget it and forgive! We have no right to punish

But the Christian view of punishment may not be the same when the punishment of the evildoer is a question for the state rather than for the individual Avenge not yourselves St Paul commands for it is written Vengeance is mine I will repay saith the Lord The individual need not avenge himself for God punishes the wicked not only God but the ruler of the earthly state who St Paul says is the minister of God to thee for good But if thou do that which is evil be afraid for he beareth not the sword in vain for he is the minister of God a revenger to execute wrath upon him that doeth evil

A life for a life appears to be the symbolic statement of the *lex talionis* in the Greek as well as the Hebrew tradition Justice claims aloud her debt the Chorus explains in the *Choephoroe* of Aeschylus. Who in blood hath dipped the steel, deep in blood her meed shall feel Whosoever shall take the sword shall perish by the sword But as Aristotle points out—and similarly Aquinas in his comment on the *lex talionis* of the Old Testament—simple reciprocity does not determine the mode of retribution People *want* even the justice of Rhadamanthus to mean this Should a man suffer what he did right justice would be done Yet Aristotle points out in many cases reciprocity and rectificatory justice are not in accord *e g* if an official has inflicted a wound he should not be wounded in return and if someone has wounded an official he ought not to be wounded only but punished in addition Retaliation consists in reciprocity only if it is in accordance with a proportion and not on the basis of a precisely equal return

Punishment as retaliation may seem to be inseparable from revenge Yet according to Lucretius the surrender of primitive freedom for the restrictions of civilized life is motivated by the desire to substitute equitable retribution for unlimited vengeance Mankind tired out with a life of brute force lay exhausted from its feuds and therefore the more readily it submitted of its own free will to laws and stringent codes As each man moved by anger took measures to avenge himself with more severity than is now permitted by equitable laws for this reason men grew sick of the life of brute force

Hegel tries to clarify what he regards as a popular confusion of retribution with revenge. In that condition of society he writes, when there are neither magistrates nor laws, punishment always takes the form of revenge revenge remains defective inasmuch as it is the act of a subjective will It is understandable that retribution should be objected to on the ground that it looks like something immoral *i e* like revenge and that thus it may pass for something personal Yet it is not something personal but the concept itself which carries out retribution Vengeance is mine saith the Lord as the Bible says The Eumenides sleep but crime awakens them and hence it is the very act of crime itself which vindicates itself.

The apparent contradiction in the identity and difference of retribution and revenge can, in Hegel s opinion be resolved On the one hand it can be said that the annulment of crime is retribution insofar as retribution in *conception* is an injury of the injury On the other hand it can be said that the annulling of crime in this sphere where right is immediate is principally revenge which is just in its content insofar as it is retributive The demand that this contradiction be resolved is the demand for justice not as revenge but as punishment

Hegel s resolution seems to be in terms of a distinction between the particular and the universal When the right against crime has the form of revenge it is only right implicit not right in the form of right *i e* no *act* of revenge is justified Instead of the injured party the injured *universal* now comes on the scene and this

has its proper actuality in the court of law It takes over the pursuit and the avenging of crime and this pursuit consequently ceases to be the subjective and contingent retribution of revenge and is transformed into the genuine reconciliation of right with itself i.e into punishment

On this conception of punishment Hegel like Kant decries every utilitarian purpose for punishment Such misconceptions of punishment arise he says from the supposition that both crime and its annulment are unqualified evils which makes it seem quite unreasonable to will an evil merely because another evil is there already To give punishment this superficial character of an evil is amongst the various theories of punishment the fundamental presupposition of those which regard it as a preventive a deterrent a threat as reformative etc and what on these theories is supposed to result from punishment is characterized equally superficially as a good But the pre ise point at issue is wrong and the righting of it If you adopt that superficial attitude toward punishment you brush aside the objective treatment of the righting of wrong

THE ISSUE WOULD SEEM to be a conflict between justice and expediency with the utilitarians ident fying retribution with revenge and demanding that punishment serve some good or mitigate some evil But sometimes the question is whether justice and expediency are compatible

In the debate on the treatment of the Mytilenians which Thucyd des reports Cleon calls upon the Athenians to show no mercy to their rebellious subjects Their offence he says was not involuntary but of mal ce and deliberate and they deserve to be punished If you follow my advice you will do what is just towards the Mytilenians and at the same time expedient. For if they were right in rebelling you must be wrong in ruling However if right or wrong you determine to rule you must carry out your principle and punish the Mytilenians as your interest requires

D odotus objects to the pol cy of putting the Mytilenians to death on the ground that it is not a question of justice but of expediency We are not in a court of justice he says but in a political assembly and the question is not justice but how to make the Mytilenians useful to Athens I consider it far more useful for the preservation of our empire to put up with injustice than to put to death however justly those whom it is our interest to keep alive As for Cleon s idea that in punishment the claims of justice and expediency can both be satisfied facts do not confirm the possibility of such a combination

In the chapter on justice in *Utilitarianism* Mill seems to place justice above expediency but he also seems to reduce retribution to revenge and call it just The sentiment of justice which includes as one of its elements the desire to punish Mill identifies with the natural feeling of retaliation or vengeance Retribution or the giving of evil for evil he says becomes closely connected with the sentiment of justice and is universally included in the idea The principle of giving to each what they deserve he adds that is good for good as well as evil for evil is not only included within the idea of Justice as we have defined it but is a proper object of that intensity of sentiment which places the Just in human estimation above the simply Expedient

Other writers seem to think that the utility of punishment is not incompatible with its retributive justice The great theologians for example considering the difference between the eternal punishment of the damned in Hell and the cleansing punishment of the repentant in Purgatory do not find it impossible for divine justice to include both absolute retribution and punishment which may be remedial as well as retributive Purely retributive punishment seems justifiable to them but they do not think that punishment can ever be justified simply by its utility—by the good it achieves—without any reference to the retaliation of evil for evil.

In the context of saying that the institution of slavery among men is a just punishment for Adam s sin and that God knows how to award fit punishments for every variety of offence Augustine observes that we must not only do harm to no ma but also restra n him from s n or punish his sin so th t either the man himself who is punished may profit by h s experience or others be arned of his example. Here there

seems to be no thought that retribution excludes a reformative or deterrent use of punishment Aquinas even more explicitly combines the remedial and the deterrent utility of punishment with the function of punishment to preserve the order of justice by meting out an equitable retribution

In willing justice God wills punishment according to Aquinas The order of justice belongs to the order of the universe and this requires that penalty should be dealt out to sinners But just retribution is not the only reason for punishment Sometimes it is for the good of those who are punished sometimes for the amendment of others These reasons for punishment apply to human as well as to divine law When a thief is hanged this is not for his own amendment but for the sake of others who at least may be deterred from crime through fear of punishment Punishment is a proper effect of human law not merely because justice requires it but because the law makes use of the fear of punishment in order to ensure obedience

In discussing the proportion between the severity of the penalty and the gravity of the fault in the punishment of sin under the Mosaic law Aquinas explains that in addition to the reason of justice (that a greater sin other things being equal deserves a greater punishment) there is the purpose of reformation (since men are not easily cured of habitual sin except by severe punishments) and the purpose of prevention (for men are not easily deterred from such sins unless they be severely *punished*) Here three reasons for punishment are stated side by side But in the opinion of Aquinas retribution is more than the primary it is the one indispensable reason for punishment cannot be justified except as doing the work of justice

THE VIEW OF KANT AND Hegel that retribution or retaliation is *the only basis* for punishment—not merely the primary or the indispensable *reason*—meets its exact opposite in what appears to be the completely utilitarian theory of punishment to be found in the writings of Plato Hobbes Locke and *Rousseau*

In the *Protagoras* arguing for the proposition that virtue can be taught Protagoras insists that no one punishes the evil doer for the reason that he has done wrong—only the unreasonable fury of a beast acts in that manner But he who desires to inflict rational punishment does not retaliate for a past wrong which cannot be undone. He has regard to the future and is desirous that the man who is punished and he who sees him punished may be deterred from doing wrong again He punishes for the sake of prevention thus clearly implying that virtue is capable of being taught

Plato himself seems to adopt the opinion of Protagoras In the *Laws*—wherein he sets forth the provisions of a penal code in a detail equalled in the tradition of the great books, only by the proposals of Hobbes—Plato says no man is to be punished because he did wrong for that which is done can never be undone but in order that in the future times he and those who see him corrected may utterly hate injustice or at any rate abate much of their evil doing Yet he also goes on to say that the law should aim at the right measure of punishment and in all cases at the deserved punishment This qualification seems in turn to be balanced by his remarks on the death penalty which he thinks should be imposed only on the incurable who cannot profit from punishment and whose execution would be an example to other men not to offend

The notion of desert in Plato s theory of punishment appeals to justice without implying any separation between retribution and reform In the *Gorgias* Socrates says that to suffer punishment is another name for being justly corrected when you do wrong A wrongdoer who escapes punishment suffers a greater evil than one who is punished for he who is punished and suffers retribution suffers justly Thereby justice is restored to his soul. The judge who prescribes just punishments cures the soul as the physician who prescribes the right remedies cures the body The criminal who having been unjust goes unpunished has no deliverance from injustice

The fact that just punishments are deserved does not seem to be the reason why men should be punished Considering the penalties imposed by gods and men in the next world *or in this*, Socrates summarizes his argument by saying that the proper office of punishment is two-

fold he who is rightly punished ought either to become better and profit by it or he ought to be made an example to his fellows that they may see what he suffers and fear and become better Those who are improved when they are punished by gods and men are those whose sins are curable and they are improved as in this world so also in another by pain and suffering

Like Plato Hobbes places the reason for pun ishment in the future rather than in the past—in its utility to procure certain effects rather than in its effecting retaliation He states it as a law of nature that in revenges (that is retribu tion of evil for evil) *men look not at the greatness of the evil past but the greatness of the good to fol low* Whereby we are forbidden to inflict pun ishment with any other design than for the cor rection of the offender or the direction of others Anything else he calls an act of hos tility

The chief aim of punishment in securing the reformation and the deterrence of criminals Hobbes thinks is to maintain public peace A punishment is an evil inflicted by publ c au thority on those who have transgressed the law to the end that the will of men may there by the better be disposed to obedience A law without a penalty attached is not a law but vain words It fails to achieve the end of law which is the same as the end of punish ment. The worst offenses—those to be pre vented by the most severe penalties—are crimes not against individuals but those that are of most danger to the public

Locke also derives from natural law the right to punish those who transgress that law for restraint and preventing the like offence to which he adds that each transgression may be punished to that degree and with so much severity as to make it an ill bargain to the of fender give him cause to repent and terrify others from doing the like This theory of punishment applies not only to man living in a state of nature but in civil society as well

Though Rousseau describes the wise states man as one who knows how by punishing crimes to prevent them he lays greater em phasis on the other motive for punishment—the reformation of the criminal There is not a single ill doer who could not be turned to some good The State has no right to put to death even for the sake of making an example anyone whom it can leave alive without danger Or as Fetyukovitch says in his address to the jury in the *Brothers Karama ov* The Russian court does not exist for punishment only but also for the salvation of the criminal Let other nations think of retribution and the letter of the law we will cling to the spirit and the meaning—the salvation and the reformation of the lost

THIS GREAT ISSUE CONCERNING the reason for or purpose of punishment seems to affect most of the other questions which men raise about the penalties to be imposed for wrongdoing—whether the wrong is a sin a crime or a vicious act and whether it is God or the state nature or the individual himself who inflicts the pain The reverse also seems to be true These other questions raise difficulties or issues which test the conflicting theories that punishment should be a just retaliation *exclusively* or should be justified *only* by its consequences or should somehow be a *combination* of awarding just de serts and securing good effects

For example the question of how the various modes and measures of punishment should be determined and assigned to diverse acts of wrongdoing does not seem to be answerable in the same way when the principle is simply retri bution and when the purpose of punishment is reformation and deterrence On the principle of retribution the gravity of the offence ap pears to be the only determinant of the severity of the punishment The punishment should fit the crime not the nature of the criminal as someone capable of being benefitted by punish ment

Kant and Hegel do not think that the justi fication of the death penalty for example de pends on the curability or incurab lity of the offender Nor do they think that the taking of the criminal s life should be motivated as Aquinas and Locke seem to suggest by the desire to protect society from his future dep redations It is sufficient that he has taken a life or committed some equally serious injury which ought to be repaid by a proportionate requital

What is nvolved in the act on of the crim inal, Hegel writes is not only the concept of crime the rational aspect in crime as such

whether the individual wills it or not the aspect which the state has to vindicate but also the abstract rationality of the individual s *volition* Since that is so Hegel argues punishment is regarded as containing the criminal s right and hence by being punished he is as honored as a rational being He does not receive this due of honor unless the concept and measure of his punishment are derived from his own act Still less does he receive it if he is treated either as a harmful animal who has to be made harmless or with a view to deterring or reforming him

On these grounds Hegel criticizes Beccaria s unqualified opposition to the death penalty In addition he rejects Beccaria s theory that it could not be presumed that the readiness of individuals to allow themselves to be executed was included in the social contract Rousseau takes the diametrically opposite view He argues for the death penalty on the ground that we consent to die if we ourselves turn assassins in order to protect ourselves from falling victims to assassins In making this con ent a part of the social contract Rousseau holds that we think only of securing [our own lives] and it is not to be assumed that any of the parties then expects to get hanged

Hegel disagrees with both Beccaria and Rousseau According to him, the state is not based upon a social contract nor does he admit that its fundamental essence [involves] the unconditional protection and guarantee of the life and property of members of the public as individuals On the contrary he holds it is that higher entity —the state— which even lays claim to this very life and property and demands its sacrifice

The state therefore according to Hegel cannot be denied the right of inflicting capital punishment Hegel admits that Beccaria s requirement that men should give their consent to being punished is right enough but he adds that the criminal gives his consent already by his very act The nature of the crime no less than the private will of the individual requires that the injury initiated by the criminal should be annulled However that may be he continues Beccaria s endeavor to have capital punishment abolished has had beneficial effects. Because of the efforts made by Joseph II and Napoleon to abolish it we have begun to see Hegel thinks which crimes deserve the death penalty and which do not Capital punishment has in consequence become rare, as in fact should be the case with this most extreme punishment

The attitude toward the death penalty as well as toward all other punishments is different when the *only* purpose of punishment is the welfare of society and the improvement of individuals whether they are actual or potential offenders The modes and degrees of punishment must then be determined by considering their effectiveness as means to the ends in view Montesquieu discusses the penal codes in various systems of law entirely in terms of their success in preventing crime Though he does not seem to think that punishment can improve the character of the individual he believes that a certain proportion between the penalty and the offense may tend to reduce the extent and gravity of crimes In Russia he says where the punishment of robbery and murder is the same they always murder

In general Montesquieu is opposed to unduly severe punishments and especially to cruel and unusual punishments not so much on the grounds of injustice as for the protection of liberty and public morals Hobbes Locke and Rousseau similarly discuss the severity of punishment with reference to its utility and like Montesquieu they face the problem that the same measure or degree of punishment may not be equally effective for the purposes of reformation and deterrence Severe penalties for example may have a greater deterrent effect upon potential offenders than milder forms of punishment but they may also tend to harden criminals instead of reforming them

The conflict of principles in the determination of punishments seems to be even more marked in the case of those who try to combine retribution with utility If for example the death penalty is the just desert for murder should it be applied on the grounds of retribution even though a particular murderer can be reformed by milder treatment? If heavy penalties were to prove highly effective as deterrents should they be applied to minor offenses which deserve less severe retaliations in order to reduce the amount of crime?

THERE SEEMS TO BE AGREEMENT for the most part on who shall have the authority to punish and who shall be subject to punishment in the relation of men to one another to the state and to God Punishment seems to be annexed to law as indispensable for its enforcement so that whoever has the authority to set rules of conduct for another also has the authority to impose penalties for their violation Yet the notion that punishment is a necessary sanction for law—which is apparently shared by those who take the retributive and those who take the utilitarian view of punishment—does not seem to fit both views equally well at least not to the extent that the end of law and its enforcement is the common good or the public welfare

Again it seems to be generally agreed that moral responsibility on the part of offenders is an indispensable condition of just punishment for their misdeeds Unless the sinful or the criminal act is voluntary unless it is intentional rather than accidental—or if negligent capable of being attributed to a willful error of judgment—the act is without fault and the agent without guilt But although those who make punishment retributive and those who make it reformative or deterrent seem to agree upon responsibility as prerequisite this principle does not seem to be equally consistent with both theories—at least not to the extent that the exemplary punishment may deter others quite apart from the responsibility of the person punished

The question of responsibility raises other difficulties *e g* the metaphysical issue about personal identity on which Locke takes the stand that unless the human individual is an enduring substance he cannot deserve subsequent punishment for his prior acts and the issue of free will and causality on which Hume s position seems to be that unless human actions are subject to causal necessity a man cannot be blamed for his acts or become the object of punishment or vengeance

Finally there is the problem of a natural need for punishment and of the penalties which nature itself imposes for wrongdoing to fulfill this need The familiar statement that virtue is its own reward and vice its own punishment is sometimes interpreted to mean that virtue and vice are intrinsically good and evil and sometimes to mean that through their natural consequences they heap benefit or injury on their possessor

Augustine for example says that by the sins which he committed God did justly punish him for every disorder in the soul is its own punishment and Kant distinguishes juridical from natural punishment in which Crime as Vice punishes itself and does not as such come within the cognizance of the Legislator The other interpretation seems to be represented by Hobbes theory that intemperance is naturally punished with diseases injustice with the violence of enemies cowardice with oppression In the chain of consequences started by any action he discerns the pains which are the natural punishments of those actions that are the beginning of more harm than good

But according to Freud it is the craving for punishment rather than the punishment which is natural *i e* psychologically determined Individuals punish themselves or seek to be punished for what is either real or fancied guilt The unconscious need for punishment plays a part in every neurotic disease Freud writes It behaves like a part of the conscience like the prolongation of conscience into the unconscious and it must have the same origin as conscience that is to say it will correspond to a piece of aggressiveness which has been internalized and taken over by the super ego If only the words were less incongruous we should be justified in calling it an unconscious sense of guilt

Whatever its psychological validity Freud s theory does not resolve the moral issue concerning the justice or utility of punishment Nor does it eliminate the possibility of other motives for submitting to punishment voluntarily Socrates in the *Crito* explains that he refuses to escape from the death penalty he thinks he does not deserve in order to uphold the law which is itself just even though in his own case it has been unjustly applied by men Thoreau and Gandhi refuse to obey laws their consciences cannot approve but do not resist the state s demand that they be punished for the law s infraction In an unjust society going to prison is for them the necessary fulfillment of the revolution begun by civil disobedience

OUTLINE OF TOPICS

REFERENCES

To find the passages c ted use the numbers in heavy type wh ch are the volume and page numbers of th pa sages referred to Fo example in 4 HOM R *Iliad* K II [265- 83] 12d the number 4 i the number of the volume in th set the number 12d indicates that the pas sa e is in section d of page 12

PAGE SECTIONS When the text is pr nted in one column the letters a and b refer to the upper and lower halves of the pa For example in 53 JA ES *Psychol gy* 116 119b the passage beg ns in the upper half of p ge 116 and end in the lower half of page 119 When the text is p inted n t vo col mns the letters a and b refer to the upper and lower halves of the left hand side of the page the lett rs c and d to th upper and low halves of the r ght hand s de of th page For example in 7 PLATO *Symp sii m* 163b 164c the passage begins in the lower half of the left hand side of pa e 163 and ends in the upper half of the r ght hand s de of pag 164

Chapter 75 QUALITY

INTRODUCTION

IT is sometimes supposed that the fundamental categories in terms of which men think they are describing reality or their experience merely reflect the conventions of their language Substance and attribute—and among attributes quality and quantity—happen to be fundamental categories in western thought it is held only because the group of languages which the western cultures use all have a grammatical structure that involves a distinction between noun and adjective and between different kinds of adjectives It is said for example that Aristotle s enumeration of the categories is merely a verbal classification based on Greek grammar When he says that the basic terms of discourse represent substances qualities quantities relations and so forth he is recognizing the grammatical difference between such words as man and white or between white and six feet tall and double The lineaments of reality the varieties of being or the modes of experience are not it is held thereby finally described

In the tradition of the great books another interpretation generally prevails Even those who disagree in one way or another about the basic categories *do not regard them as conventional* or of linguistic origin Kant for example disagrees with Aristotle s listing of the categories He makes substance a mode of relation rather than coordinate with quality quantity and relation He calls his categories transcendental to indicate that they are not drawn from experience and that as *a priori* forms of thought they determine the structure of all possible experience Aristotle on the other hand draws his categories from experience He thinks that they represent fundamental modes of being and that they are therefore the basic concepts in terms of which thought apprehends reality Despite all these differences Kant and Aristotle agree that the categories signify real—not verbal—distinctions Their agreement on this point seems to be shared even by those like Hume who question our ability to know whether substances exist or those like Berkeley who question the validity of the distinction between quality and quantity

In one sense no one questions the existence of qualities as they do the existence of substances—the enduring things, material or otherwise in which qualities are supposed to inhere Everyone somehow acknowledges the hot and the cold the light and the dark, the moist and the dry the hard and the soft But such acknowledgement does not preclude a number of basic questions about quality on which much disagreement exists

Are qualities attributes? Do they exist that is only as *qualifiers* only as belonging to some thing else? Or do they exist independently in and of themselves? If qualities are attributes do they belong to things quite apart from our experience of them or do they belong to things only as experienced and have no separate reality? Do things have in reality certain attributes that cause in us the experience of other traits which we then attribute to the things themselves?

Are all the attributes of things whether in or apart from experience to be conceived as qualities and if so are there different kinds of qualities? Or is quality only one kind of attribute and if so how is quality related to other kinds of attributes? Is quality for example distinct from quantity dependent on quantity reducible to quantity affected by quantity?

These questions appear to be related in ways which make the issues they raise dependent on one another If, in addition their presuppositions and implications are observed it will be seen that they cannot be fully discussed without entering into matters considered in other chap-

ters such as the notions of substance and accident in the chapter on BEING the theory of experience and the various accounts of sense perception and the objects of sense in the chapters on EXPERIENCE and SENSE and of course some of the principal topics considered in the closely related chapter on QUANTITY

SPINOZA DISTINGUISHES between substance and mode as that which exists in itself and that which exists in another thing He lays down as an axiom that everything which is is either in itself or in another Whether or not qualities are modes of substance it seems to be clear that Spinoza would not call them substances The notion of qualities existing in themselves and not as the qualities *of* anything seems to be self contradictory As Descartes points out to assert the existence of real accidents by which he means the existence of qualities or quantities apart from substances is to deny the distinction between substance and accident Substance he writes can never be conceived after the fashion of accidents nor can it derive its reality from them whereas no reality can be ascribed to [accidents] which is not taken from the idea of substance

Anyone who acknowledges the distinction between substance and accident also conceives qualities as accidents or attributes *i e* as existing in the things they qualify Spinoza Descartes Locke and Aristotle do not conceive substance in the same way nor do they all use the word accident to name the characteristics which inhere in substance Locke for example uses the word quality with almost the same generality that Spinoza gives to the word mode or Descartes and Aristotle to accident And the word substance Locke uses in a sense that is nearer to Aristotle s meaning for the word matter when in trying to conceive bare substance as the underlying I know not what Locke defines this substratum as that which supports qualities Apart from its qualities substance has no positive characteristics

Nevertheless such differences in theory leave untouched the point of agreement that qualities do not float freely—without any support—in either reality or experience Even Berkeley s denial of matter or of bodies existing apart from their being perceived does not turn qualities into substances for qualities *as perceived* are the qualities of bodies *as perceived* and both together have their existence *in* the perceiver

The contrary view—that qualities exist in and of themselves—does not seem to receive clear or explicit expression in the tradition of the great books It may be implied in the conception of experience which Hume develops more fully in the *Treatise on Human Nature* than in the *Enquiry* There it seems to be supposed that each element of experience has the same reality as any other that each stands by itself without any perceptible dependence upon any other and that it has no existence beyond its momentary appearance On this view no enduring substances exist In addition it is as appropriate to call the elements of experience qualities as it is to call them anything else. Experience can be described as nothing but qualities and relations—or as qualities related by succession and contiguity

The notion that experience is a continual flux in which nothing has a continuing identity from moment to moment seems to be basic to any theory which denies substances and affirms the independent reality of qualities The theory of qualities which Plato attributes to Heraclitus or his followers illustrates this. Their first principle Socrates tells Theaetetus is that all is motion and upon this all the affections of which we were just now speaking are supposed to depend there is nothing but motion which has two forms one active and the other passive both in endless number and out of the union and friction of them is generated a progeny endless in number having two forms sense and the object of sense

For example when the eye and the appropriate object meet together and give birth to whiteness and the sensation connatural with it then while the sight is flowing from the eye whiteness proceeds from the object which combines in producing the color This is true of all sensible objects hard warm and the like which are similarly to be regarded not as having any absolute existence but as being all of them generated by motion in their intercourse with one another for the agent has no existence until united with the patient and the patient has no existence until united with the agent

And from all these considerations Socrates says there arises a general reflection that there is no self existent thing but everything is be coming and in relation

Socrates explains that for those who assert a universal flux qualities are not only the prod ucts of motion but also are themselves in motion— not even white continues to flow white and whiteness itself is a flux or change which is passing into another color There is no need to refute this doctrine Socrates thinks since it refutes itself by its unintelligibility or worse its inability to say anything definite in conse quence of denying that words can have a con stant meaning from moment to moment

Aristotle concurs in this attitude toward the most extreme view of the professed Heracli teans but goes on to remark that not even at different times does one sense disagree about the quality but only about that to which the quality belongs I mean for instance that the same wine might seem if either it or one s body changed at one time sweet and at another time not sweet but at least the sweet such as it is when it exists has never yet changed The sweet thing may become sour either in itself or to us but sweetness itself never becomes sourness

THAT QUALITIES DO NOT change into one an other whereas substances undergoing altera tion change from one quality to another seems to Aristotle to distinguish quality from substance The most distinctive mark of substance he writes appears to be that while remaining numerically one and the same it is capable of having contrary qualities Thus one and the same color cannot be wh te and black But the same individual person is at one time white at another black at one time warm at another cold at one time good at another bad The qualities do not change but the substance in changing passes from one quality to its contrary (The difference be tween change of quality or alteration and the other types of change which substances can un dergo is discussed in the chapter on CHANGE)

Aristotle suggests another mark of d stinc tion between substance and qual ty One substance he says never sta ds to another as ts contrary in the way in which qualities are contrary to one another like hot and cold white and black good and bad A quality may have a correlative as well as a contrary *e g* if knowl edge is a quality of mind the object known is its correlative whereas ignorance of the object is the contrary of knowledge. In some cases the contrary qualities may be the extremes or limits of a continuous series of intermediates *e g* white and black with all the intermediate greys In some cases as with knowledge and ig norance the contrary qualities have no inter mediates (Contrariety and correlation most frequently exemplified by qualities are con sidered in the chapter on OPPOSITION)

Still another mark of distinction between substance and quality according to Aristotle is that qualities *do* and substances *do not* admit of variation in degree One man cannot be more man than another he writes as that which is white may be more or less white than some other white object The same quality moreover is said to subsist in a thing in varying degrees at different times A white body is said to be whiter at one time than it was before or a warm body is said to be warmer or less warm than at some other time

This observation raises a number of ques tions Does variation in the degree of a quality *from time to time imply that qualities them* selves undergo change just as substances un dergo change in quality? Do they remain one and the same in kind while varying in degree? Is this change which qualities undergo as they increase or decrease in intensity a change in *quantity? Furthermore* does the fact *that* something white can become more or less white mean that a quality can have a certain quantity even as a body can? Aquinas suggests an answer by distinguishing between what he calls the dimensive quantity of bodies and the virtual quantity of qualities Virtual qu ntity is the degree or intensity wh ch non-quantitative at tributes may possess—such personal qualities as virtues and habits or such corporeal qualities as colors and textures

But this still seems to leave a very difficult question to be answered How can qualities have the attribute of quant ty w thout becom ing substance ? On the principle wh ch both Aristotle and Aqu nas ccept—that accidents exist only in substances—how can one kind of

ticle of matter though less than to make itself singly perceived by our senses Locke s enumeration of these original or primary qualities of body which we may observe to produce simple ideas in us *viz* solidity extension figure motion or rest and number closely resembles Newton s list of the universal qualities of perceptible bodies and of their least particles or atoms

In contrast the secondary qualities such as colors sounds tastes etc are nothing in the objects themselves but powers to produce various sensations in us by their primary qualities *i e* by the bulk figure texture and motion of their insensible parts From whence Locke declares I think it is easy to draw this observation that the ideas of primary qualities of bodies are resemblances of them and their patterns do really exist in the bodies themselves but the ideas produced in us by these secondary qualities have no resemblance of them at all There is nothing like our ideas existing in the bodies themselves They are in the bodies we denominate from them only a power to produce those sensations in us what is sweet blue or warm in idea is but the certain bulk figure and motion of the insensible parts in the bodies which we call so

Locke thinks the sensation of pain confirms this insight As the piece of steel which by its corporeal properties has the power to produce pain in us does not itself have the quality of pain so it does not have anything corresponding to the ideas of blueness or coldness which it produces in us except the power to produce these ideas through the action of its primary qualities on our senses Yet Locke maintains that all our simple ideas of quality—not only of primary but al o of secondary qualities— agree with the reality of things By *agreement* he does not mean *resemblance* in the sense of copying and tl erefore he thinks he can without inconsistency deny any *resemblance* between sensations of color or taste and the secondary qualities of bodies while saying that if *sugar produces* in us the ideas we call whiteness and sweetness ve are sure there is a power in sugar to produce those ideas in our minds or else they could not have been produced by it

Locke s point however is sometimes given exactly the opposite implication Earl er thinkers who do not speak of primary and secondary qualities attribute to bodies only the characteristics which Locke calls primary and give what he calls secondary qualities no reality at all that is no existence outside the mind The secondary qualities are not qualities of things, but of sensations or images Descartes for example says that nothing belongs to the nature or essence of body except length breadth and depth admitting of various shapes and various motions On the other hand colors, odors savours and the rest of such things are merely sensations existing in my thought and differing no less from bodies than pain differs from the shape and motion of the instrument which inflicts it

Hobbes similarly regards the various sensible qualities as feelings in us—the seemings or fancies of sense All these qualities called sensible are in the object that causes them nothin but so many several motions of the matter The object is one thing the fancy is another One type of absurd assertion in the opinion of Hobbes consists in giving the names of th accidents of bodies without us to the accidents of our own bodies as they do that say *the color is in the body the sound is in the air* etc"

The attributes or accidents which Descartes and Hobbes assign to bodies seem to be quantities rather than qualities Accordingly where as Locke attributes both primary and secondary *qualities* to bodies Hobbes and Descartes seem to be saying that bodies differ from one another only quantitatively and that qualities or qualitative differences occur only in the realm of sense or thought Expounding the atomism of Democritus and Epicurus Lucretius appears to make precisely this point when he says that the first beginnings or atoms are characterized only by size weight shape and motion Th bodies of matter he writes have no color at all They are bereft not only of color they are also sundered altogether from warmth and cold and fiery heat and are carried alon barren of sound and devoid of taste" These qualities caused by the blo vs of the atoms upon the sense organs of animals are the qualities of sensations not of things

THE CRITICS OF THIS THEORY—whether in the formulation of Locke or in that of Descartes,

Hobbes and Lucretius—seems itself to take two forms Aristotle for example criticizes Democritus and the atomists for treating perceptible qualities differently from perceptible quantities According to his own theory of the objects of sense some like colors sounds odors flavors—which Locke calls secondary qualities and the others simply qualities —are the proper objects of the special senses, such as sight hearing smell taste In contrast to these proper sensibles each exclusively perceived by one and only one sense there are the common sensibles such as size and shape number movement and rest which can be perceived commonly by several senses e g shape is visible and tangible motion is visible and audible Such sens ble attributes of body which Locke calls primary qualities, Aristotle no less than Hobbes or Lucretius regards as quantities not qualities. Reporting his view Aquinas writes that the common sensibles are all reducible to quantity

Aristotle s critical point seems to be that the atomists reduce the proper to the common sensibles as Democritus does with white and black for he asserts that the latter is a mode of the rough and the former a mode of the smooth while he reduces savours to the atomic figures The atomists sometimes make the opposite error of representing all objects of sense as objects of touch. But in either case they have no ground in Aristotle s opinion for giving to certain sensible attributes—whether these be tangible qualities or the commonly sensible quantities—an objective reality they deny to other sensible traits like colors sounds and odors

Aristotle s theory of sensation and the sensible is discussed more fully in the chapter on SENSE. According to it the qual ties no less than the quantities perceptible by sense have real or actual existence as the attributes of bod es On this score Aristotle does not differentiate between qualities (the proper sensibles) and quantities (the common sens bles) Just as a body actually has the shape we pe cei e it to ha e so it actually has the color we perceive it to have on the suppos t on of course that our perception is accurate in both cases If the senses are fall ble at all we are less prone to make errors, Aristotle thinks in the field of the proper than of the common sensibles e g the stick in water which looks bent to the eye feels straight to the hand

PRECISELY THE OPPOSITE direction seems to be taken by Berkeley and Hume Where Aristotle criticizes the atomists for treating quantities (or common sensibles) as objective and qualities (or proper sensibles) as subjective Berkeley criticizes Locke for treating primary and secondary qualities differently Where Aristotle s own theory assigns the same reality to all objects of sense granting them an actuality apart from perception, Berkeley makes the actuality of the primary as well as the secondary qualities dependent upon their being perceived

Some there are writes Berkeley who make a distinction betwixt *primary* and *secondary* qualities By the former they mean extension figure motion rest sol dity or impenetrability and number by the latter they denote all other sensible qualities as colors sounds tastes and so forth The ideas we have of these they acknowledge not to be the resemblances of anything existing without the mind or unperceived but they will have our ideas of the primary qualities to be patterns or images of things which exist without the mind n an unthinking substance which they call Matter

Berkeley then argues that the so-called primary qualities are incapable of being separated in reality or thought from the secondary qual it es and that therefore, the one like the other exists only in the mind In short let anyone consider those arguments which are thought manifestly to prove that colors and tastes exist only in the mind and he shall find they may with equal force be brought to p ove the same *thing of extens on figure and motion* His own arguments he thinks plainly show it to be imposs ble that any color or extension at all or other sensible quality whatsoever should exist in any unthinking subject without th mind or in truth that there should b such th ng as an outward object

Hume professes to adopt Berk ing It is universally allowed b quirers he writes that all th it es of obje ts such as h whit bla k, tc. ar

Chapter 76 QUANTITY

INTRODUCTION

As indicated in the chapter on Quality the traditional consideration of that fundamental notion involves questions concerning the relation of quality and quantity and the priority of one or the other in the nature of things According to one theory of the elements difference in quality rather than in quantity seems to be the defining characteristic Certain kinds of qualities it is thought inhere in substances directly and without being based upon their quantitative aspects But it is seldom if ever suggested that quality takes universal precedence over quantity

In the tradition of western thought the opposite view—that quantities are primary—seems to occur with some frequency at least so far as the realm of material things is concerned It is held that bodies have only quantitative attributes Such sensible qualities as colors odors tastes textures are thought to have no reality apart from experience or as it is sometimes put red and blue hot and cold sweet and sour are the qualities of sensations not of things

Those who think that bodies can exist without being perceived also tend to think that bodies can exist totally bereft of qualities but never without the d mens ons of quantity The notions of matter and quantity seem to be inseparably associated For matter to exist without existing in some quantity seems to be as inconceivable as for experience to exist without qualitative dive sity As if there could be matter says Hobbes that had not some determined quantity when qu ntity is nothing else but determinat on of matter that is to say of body by wh ch we say that one body is greater or less than another by thus or thus much

The use of the word quality where quantity appears to be meant only slightly obscures this point Newton refers to extension hardness impenetrability mobility and inertia as the qualities of bodies which are to be esteemed the universal qualities of all bodies whatsoever Following him Locke calls our simple ideas of solidity extension figure motion or rest and number ideas of the original or primary qualities of bodies and says that even if bodies are divided till their parts become insensible they must retain still each of them all those qualities For division can never take away either solidity extension figure or mobility from any body but only makes two or more distinct separate masses of matter of that which was one before

Though Locke uses the word quality for those attributes which belong to bodies even when they are not sensed or are not even sensible he also appears to recognize that number extens on and figure are as the tradit onal objects of the mathematical sciences traditionally regarded as quantities rather than qualities It has been generally taken for granted he writes that mathematics alone are capable of demonstrative certainty but to have such an agreement or disagreement as may intuitively be perceived being as I imagine not the privilege of the ideas of number extension and figure alone it may possibly be the want of due method and application in us that demonstration has been thought to have so little to do in other parts of knowledge Yet he adds in other simple ideas whose modes and d fferences are made and counted by degrees and not quantity we have not so n ce and accurate a d stinction of their differences as to perceive or find ways to measure their just equality

Newton also gives some indication that his universal qualit are quantit es H estricts them to ttributes wh cl dm t ne ther intensification no rem on of degrees One dif-

ference between quantity and quality according to an ancient opinion is that qualities are subject to variation in degree quantities not One thing may be white or hot to a greater or less degree than another Aristotle observes but one thing cannot be two cubits long in a greater degree than another Similarly with regard to number what is three is not more truly three than what is five is five Nor is there any other kind of quantity of all that have been mentioned with regard to which variation in degree can be predicated

GRANTED THAT WHAT Newton and Locke call qualities are not qualities except in the sense in which the word quality means attribute difficult questions remain concerning their enumeration of the *universal* or *primary* attributes of bodies Do extension hardness impenetrability motion and rest figure and number constitute an exhaustive enumeration? Are these *all* the corporeal quantities or only the basic ones from which others can be derived? Are they all of the same kind and among them are some more fundamental than others?

Descartes for example seems to make extension the one primary attribute of bodies I observed he writes that nothing at all belonged to the nature or essence of bodies except that it was a thing with length breadth and depth admitting of various shapes and various motions I found also that its shape and motions were only modes which no power could make to exist apart from it Finally I saw that gravity hardness the power of heating of attracting and of purging and all other qualities which we experience in bodies consisted solely in motion or its absence and in the configuration and situation of their parts

With motion and figure modes of extension and all the other properties of bodies the result of their motions or configurations the three dimensions of extension (or spatial magnitude) become almost identical with body itself Considering the statement *body possesses extension* Descartes points out that though the meaning of *extension* is not identical with that of *body* yet we do not construct two distinct ideas in our imagination one of body the other of extension but merely a single image of extended body and from the point of view of the thing it is exactly as if I had said *body is extended* or better *the extended is extended*

But Descartes adds when we consider the expression *extension is not body* the meaning of the term *extension* becomes otherwise than as above When we give it this meaning there is no special idea corresponding to it in the imagination It becomes a purely abstract entity which may properly be the object of the geometer s consideration but then it should be treated as an abstraction and not as if it had independent reality

Aquinas also distinguishes between physical and mathematical quantities or the quantities which inhere in bodies and the quantities abstracted therefrom Quantities such as number dimension and figure which are the terminations of quantity can be considered apart from sensible qualities and this is to abstract them from sensible matter But they cannot be considered without understanding the substance which is subject to quantity —that is, corporeal or material substance. Like a body a mathematical solid has three dimensions but as Aquinas points out lacking matter this three-dimensional object does not occupy space or fill a place The three spatial dimensions are not for him however the only primary quantities of either the physical or the mathematical body Number and figure are as fundamental

Still another enumeration of corporeal quantities is given by Lucretius in his description of the properties of atoms According to him atoms vary in size weight and shape Each of these attributes is a distinct quantity not reducible to the others In addition atoms have the property which Newton calls impenetrability and Locke solidity But whereas atoms may be unequal in size and weight and different in shape or configuration they are all equal in their solidity being absolutely indivisible through lack of void or pores

THE DISTINCTION BETWEEN mathematical and physical quantity and the enumeration or ordering of diverse quantities seem to require the consideration of two prior questions. What is the nature of quantity? What are the kinds or modes of quantity?

Terms like quantity and quality do not appear to be susceptible of definition Quantity is,

perhaps *the* fundamental notion in the mathematical sciences yet neither it nor such terms as magnitude figure, and number are defined in the great books of geometry or arithmetic In Aristotle s theory of the categories as the highest genera such terms as substance quantity quality and relation are strictly indefinable if to define a term is to give its genus and differentia

With quite a different theory of the categories Kant also treats them as indefinable As indicated in the chapter on QUALITY they are for him the transcendental concepts of the understanding He uses such terms as quantity quality and relation with modality as a coordinate fourth to represent the four major groupings of the categories In his table of the categories Kant s treatment of quantity under which he lists the concepts of unity, plurality and totality parallels the treatment of quantity in his table of judgments according to which judgments are classified as universal particular and singular All these considerations of quantity belong to what Kant calls his transcendental logic So far as Kant considers quantity in its mathematical or physical (rather than logical) significance he discusses it in connection with the transcendental forms of space and time which provide according to him the *a priori* foundations of geometry and arithmetic—the sciences of magnitude and number But in none of these connections are quantity and its principal modes magnitude and number defined

Though indefinable quantity can according to Aristotle be characterized by certain distinctive marks As we have already observed where qualities admit of variation in degree quantities do not With few exceptions each quality has a contrary whereas definite quantities such as an extent or a number are not opposed by contrary quantities Aristotle considers the possibility that such apparently quantitative terms as large and small may also appear to be contrary to one another as hot is to cold or white is to black. But he argues these terms represent quantities only relatively not absolutely When things are compared with respect to size one may be judged to be both larger and small r than others but the sizes of each of two things unequal in size are not contrary to one anoth r

These two characteristics (lack of contrariety and of variation in degree) do not however satisfy Aristotle s search for a distinctive mark of quantity They apply to substances such as tree or man as well as to figures and numbers. This fact could have some bearing on the issue whether the objects of mathematics have a separate existence comparable to that of substances but in Aristotle s view at least quantities are not substances Physical quantities are the attributes of bodies the objects of mathematics consist of quantities abstracted from sensible matter

Conceiving quantity as one of the attributes of substance Aristotle says that the most distinctive mark of quantity is equality and inequality Only when things are compared quantitatively can they be said to be equal or unequal and conversely in whatever respect things are said to be equal or unequal in that respect they are determined in quantity

How far is it true Plotinus asks that equality and inequality are characteristic of quantity? It is significant he thinks that triangles and other figures are said to be similar as well as equal. It may of course be the case that the term similarity has a different sense here from that understood in reference to quality or another alternative, Plotinus adds may be that similarity is predicable of quantity only insofar as quantity possesses [qualitative] differences In any case comparison whether in terms of equality or likeness seems to generate the relationships fundamental to the mathematical treatment of quantities

Eucl d does not define magnitude in itself but only the relation of magnitudes to one another The first four defin tions in the fifth book of his *Elements* illustrate this 1 A magnitude is a *part* of a magnitude the less of the greater when it measures the greater 2 The greater is a *multiple* of the less when it is meas ur d by the less. 3 A *rat o* is a sort of relation in respect of size between two magnitudes of the same kind 4 Magnitudes are said to *have a rat o* to one another which are capable when multiplied of exceeding one another

Archimedes also states his understand ng of the distinction between kinds of magnitudes—without defining these kinds—by ef r nce to their comparability Assuming that any given

magnitude can by being multiplied exceed any other magnitude of the same kind he is able to know that magnitudes are of the same kind if by being multiplied they can exceed one another It follows that an indivisible point and a finite or divisible magnitude such as a line are not of the same kind for they cannot have a ratio to one another For the same reason the length of a line the area of a plane and the volume of a solid are not magnitudes of the same kind Since they bear no ratio to one another they are quantitatively incomparable

THE EMPHASIS UPON ratios has some significance for a controversial point in the definition of the subject matter of mathematics In the tradition of the great books mathematicians and philosophers seem to agree that arithmetic and geometry have as their objects the two principal species of quantity—number and magnitude This is the opinion of Euclid Nicomachus Descartes and Galileo it is the opinion of Plato Aristotle Aquinas Bacon Hume and Kant But writers like Russell and Whitehead who reflect developments in mathematics since the 19th century reject the traditional opinion as unduly narrowing the scope of mathematics

To give adequate expression to the universality of mathematics they sometimes propose that it should be conceived as the science not merely of quantity but of relations and order In view of the fact that the great books of mathematics deal with quantities largely in terms of their relationship or order to one another the broader conception seems to fit the older tradition as well as more recent developments Whether there is a genuine issue here concerning the definition of mathematical subject matter may depend therefore on whether the fundamental terms which generate the systems of relationship and order are or are not essentially quantitative To this question the traditional answer seems to be that the mathematician studies not relations of any sort but the relation of quantities

The problem of the kinds of quantity seems to appeal for solution to the principle of commensurability For example Galileo s observation that finite and infinite quantities cannot be compared in any way implies their utter diversity But he goes further and says that the attributes larger smaller and equal have no place either in comparing infinite quantities with each other or in comparing infinite with finite quantities. If the notion of quantity entails the possibility of equality or inequality between two quantities *of the same kind* then either infinite quantities are not quantities or each infinite quantity belongs to a kind of its own

The principle of incommensurability seems to be applied by mathematicians to distinguish quantities which are different species of the same generic kind For example the one-dimensional two-dimensional and three-dimensional quantities of a line a plane and a solid, are incommensurable *magnitudes* The number of days in a year and the number of years in infinite or endless time are incommensurable *multitudes*

The distinction between magnitude and multitude (or number) as two modes of quantity appears to be based upon another principle, that of continuity and discontinuity Yet the question can be raised whether magnitudes are commensurable with numbers, at least to the extent of being measured by numbers. It may be necessary however to postpone answering it until we have examined the fundamental difference between magnitude and multitude as generic kinds of quantity

What if magnitude and multitude or continuous and discontinuous quantity do not divide quantity into its ultimate kinds? Aquinas, for example proposes that the two basic kinds are dimensive and virtual quantity There is quantity of *bulk* or dimensive quantity he writes which is to be found only in corporeal things and has therefore no place in God. There is also quantity of *virtue* which is measured according to the perfection of some nature or form It is in the latter sense according to Aquinas that Augustine writes In things which are great but not in bulk, to be greater is to be better

Just as dimensive quantities can be incommensurable with one another so with respect to virtual quantities God s infinite perfection makes him incommensurable with finite creatures. But a dimensive quantity cannot be either commensurable or incommensurable with

a virtual quantity The standard of measure ment by which dimensive quantities are com pared and the standard by which virtual quan tities are ordered represent utterly diverse principles of commensurability Euclid s state ment that those magnitudes are said to be commensurable which are measured by the same measure and those incommensurable which cannot have a common measure cannot be extended to cover dimensive and virtual quantities for the very meaning of measure changes when we turn from the dimensions of a body to the perfections of a being

The distinction which Aquinas makes be- tween dimensive and virtual magnitudes has its parallel in the distinction he makes between two kinds of number for both depend on the difference between *material* and *formal* quan tity Division is twofold he writes One is material and is division of the continuous from this results number which is a species of quan tity Number in this sense is found only in ma terial things which have quantity The other kind of division is formal and is effected by op posite or diverse forms and this kind of divi sion results in a multitude which does not be long t) a genus but is transcendental in the sense in which being is divided by one and many Only this kind of multitude is found in immaterial things According to the example suggested in the context such is the multitude which is the number of persons in the Trinity

THE MATERIAL quantities of physics and math ematics seem to fall under the two main heads of magnitude and multitude Quantity is ei ther discrete or continuous writes Aristotle Instances of discrete quantities are number and speech of continuous lines surfaces solid and besides these time and place Nicomachus explains the two kinds of quantity by examples The unified and continuous he says is exem pl fied by an animal the un verse a tree and the like which are properly and peculiarly called magnitudes to illustrate the discon tinuous he points to heaps of things which are called multitudes a flock for instance a people a chorus and the like

The principle of this d stinction appears to be the possession or lack of a common bound ary To take Aristotle s example of speech as a quantity the letters of a written word or the syllables of vocal utterance comprise a multi tude rather than a continuum or magnitude because there is no common boundary at which the syllables join each being separate and distinct from the rest The continuity of magnitudes can be readily seen according to Aristotle in the possibility of finding a common boundary at which the parts of a line join or make contact In the case of a line he says this common boundary is the point in the case of a plane it is the line Similarly you can find a common boundary in the case of the parts of a solid namely either a line or a plane

Accepting the principle of the distinction Plotinus insists that number and magnitude are to be regarded as the only true quantities All others like space and time or motion are quantities only in a relative sense that is inso far as they can be measured by number or in volve magnitude Galileo raises another sort of difficulty The Aristotelian conception of mag nitudes as continuous quantities implies their infinite divisibility This means in his terms that every magnitude is divisible into magni tudes and that it is impossible for anyth ng continuous to be composed of indivisible parts Galileo acknowledges the objections to build ing up continuous quantit es out of indivisible quantities on the ground that the addition of one indivisible to another cannot produce a divisible for if this were so it vould render the indivisible divisible Suppose a line to com prise an odd number of indivisible points Since such a line can in principle be cut into two equal parts we are required to do the impos sible namely to cut the indivisible which l es exactly in the middle of the l ne

To this and other objections which seem to him of the same type Galileo replies that a divisible magnitude cannot be constructed out of two or ten or a hundred or a thousand indi visibles, but requires an infinite number of them I am willing he says to grant to the Peripatetics the truth of their opinion that a continuous quantity is divisible only into parts which are still further d visible so that however far the d vision and subdiv on be continued no end will be eached but I am not so certain th t th y w ll conced to me that none of these di s ons of theirs can be a final

one as is surely the fact because there always remains another the final and ultimate division is rather one which resolves a continuous quantity into an infinite number of indivisible quantities

The question remains whether these indivisible units an infinite number of which constitute the continuity of a finite magnitude can properly be called quantities At least they are not magnitudes as is indicated by Euclid s definition of a point as that which has no part or by Nicomachus statement that the point is the beginning of dimension but is not itself a dimension If in addition to having position a point had size or extent a finite line could not contain an infinite number of points This problem of infinite and infinitesimal quantities is more fully discussed in the chapter on INFINITY

WITHIN EACH OF THE two main divisions of quantity—magnitude and number—further sub-divisions into kinds are made Relations of equality and inequality or proportions of these ratios may occur between quantities different in kind—different plane figures for example But the great books of mathematics indicate other problems in the study of quantity than those concerned with the ratios and proportions of quantities The classification of lines and figures results in the discovery of the properties which belong to each type Possessing the same properties all lines or figures of a certain type are similar in kind not equal in quantity In addition to developing the properties of such straight lines as perpendiculars and parallels or such curved lines as circles and ellipses parabolas and hyperbolas the geometer defines the different types of relationship in which straight lines can stand to curves *e g* tangents secants asymptotes

As there are types of lines and figures both plane and solid so there are types of numbers Euclid and Nicomachus divide the odd numbers into the prime and the composite—into those which are divisible only by themselves and unity such as 5 and 7 and those which have other factors such as 9 and 15 The composite are further differentiated into the variety which is simply secondary and composite and the variety which in itself is secondary and composite but relatively is prime and incomposite To illustrate the latter Nicomachus asks us to compare 9 with 25 Each in itself, he writes is secondary and composite but relatively to each other they have only unity as a common measure and no factors in them have the same denominator for the third part in the former does not exist in the latter nor is the fifth part in the latter found in the former

The even numbers are divided by Nicomachus into the even times even (numbers like 64 which can be divided into equal halves and their halves can again be divided into equal halves and so on until division must stop) the even times odd (numbers like 6 10 14 18 which can be divided into equal halves but whose halves cannot be divided again into equal halves) and the odd times even (numbers like 24 28 40 which can be divided into equal parts whose parts also can be so divided and perhaps again these parts but which cannot be divided in this way as far as unity) By another principle of classification the even numbers fall into the superabundant the deficient and the perfect The factors which produce superabundant or deficient numbers when added together amount to more or less than the number itself but a number is perfect Nicomachus writes when comparing with itself the sum and combination of all the factors whose presence it will admit it neither exceeds them in multitude nor is exceeded by them It is equal to its own parts as for example 6 for 6 has the factors half third and sixth 3 2 and 1 respectively and these added together make 6 and are equal to the original number At the time of Nicomachus only four perfect numbers were known—6 28 496 8128 since his day seven more have been discovered

The further classification of numbers as linear plane and solid and of plane numbers as triangular square pentagonal etc assigns properties to them according to their configurations The analysis of figurate numbers by Nicomachus or Pascal represents one of the great bridges between arithmetic and geometry of which the other in the opposite direction is the algebraic rendering of geometrical loci in Descartes analytical geometry

In either direction of the translation between arithmetic and geometry discontinuous and continuous quantities seem to have certain

properties in common at least by analogy Euclid for example proposes numerical ratios as the test for the commensurability of magnitudes Commensurable magnitudes have to one another he writes the ratio which a number has to a number With the exception of infinite numbers all numbers are commensurable and so provide the criterion for determining whether two magnitudes are or are not commensurable

Introducing the notion of dimensionality into the discussion of figurate numbers Nicomachus observes that mathematical speculations are always to be interlocked and to be explained one by means of another Though the dimensions by which linear plane and solid numbers are to be distinguished are more closely related to magnitude yet the germs of these ideas are taken over into arithmetic as the science which is the mother of geometry and more elementary than it The translation does not seem to fail in any respect The only non dimensional number unity finds its geometrical analogue in the point which has position without magnitude

When diverse magnitudes are translated into numbers the diversity of the magnitudes seems to be effaced by the fact that their numerical measures do not have a corresponding diversity The numbers will appear to be commensurable though the magnitudes they measure are not as magnitudes comparable As Descartes points out it is necessary therefore to regard each order of magnitude as a distinct dimension

By dimension Descartes writes I understand nothing but the mode and aspect according to which a subject is considered to be measurable Thus it is not merely the case that length breadth and depth are dimensions but weight also is a dimension in terms of which the heaviness of objects is estimated So too speed is a dimension of motion and there are an infinite number of similar instances For that very division of the whole into a number of parts of identical nature whether it exist in the real order of things or be merely the work of the understanding gives us exactly that dimension in terms of which we apply number to objects

The theory of dimensions can be illustrated by the choice of clocks rules and balances as the fundamental instruments for the measurement of physical quantities They represent the three dimensions in the fundamental equations of mechanics—time distance and mass

Additional dimensions may be introduced in electricity or thermodynamics In developing the theory of heat Fourier for example enumerates five quantities which in order to be numerically expressed require five different kinds of units namely the unit of length the unit of time that of temperature that of weight and finally the unit which serves to measure quantities of heat To which he adds the remark that every undetermined magnitude or constant has one *dimension* proper to itself and that the terms of one and the same equation could not be compared if they had not the same *exponent of dimension*

A fuller discussion of the basic physical quantities their definition measurement and their relation to one another belongs to the chapter on MECHANICS The consideration of time and space as quantities or physical dimensions occurs in the chapters devoted to those subjects

Chapter 77 REASONING

INTRODUCTION

IN the tradition of western thought certain verbal expressions have become shorthand for the fundamental ideas in the discussion of which they happen to be so often repeated This may be due to the influence of the text books used in the schools which copy one from another and hand down an easily recited jargon from generation to generation In most cases the great books themselves are probably the original source though they have usually suffered over simplification or distortion when their insights are thus transmitted

Featherless biped and rational animal are for example stock phrases to illustrate the idea that a definition consists of genus and differentia—the class to which man in this instance belongs and the attribute which differentiates him from other members of this class Statements such as the whole is greater than the part or two plus two equals four similarly serve to represent axioms or at least statements which whether or not they can be proved are usually accepted as true without proof In the field of reasoning the familiar verbal landmark is All men are mortal Socrates is a man therefore Socrates is mortal Even those who have never heard of syllogisms or who are throughly innocent of the age-old controversies about the theory of the syllogism and the difference between deduction and induction might offer this sequence of statements if pressed to say what reasoning is they tried to answer by giving an example

The example shopworn though it is and far from being the perfect paradigm does convey certain insights into the nature of reasoning which are generally undisputed

The word therefore which connects the third statement with the first two signifies a relationship which is sometimes described in terms of cause and effect as by Aristotle and sometimes in terms of antecedent and consequent as by Hobbes The premises (*i e* the statements which precede the therefore) cause the conclusion it is said We know that Socrates is mortal *because* we know that Socrates is a man and that all men are mortal The premises are the cause in the sense of the *reason why* the conclusion may be regarded as true.

The conclusion is also said to *follow from* the premises or the premises are said to *imply* or *yield* the conclusion *If* the premises are tr *then* the truth of the conclusion can be inferred or proved The relationship between the premises and the conclusion seems to be the same whether the act of reasoning is called proof or inference The distinction in meaning between these two words seems to be one of direction We speak of proving a conclusion when we look toward the premises as the foundation for its truth we speak of inferring a conclusion when we look toward it as something which can be drawn from the premises.

The words if and then indicate that reasoning is a motion of the mind from one statement to another Sometimes the inference is immediate as when we argue that if all men are mortal then some mortals are men Here only two propositions are involved one of which is simply the converse of the other Those who deny that immediate inference is truly inference (because a proposition and its converse are merely two ways of stating the same fact) insist that implicitly or explicitly reasoning always involves *at least* three statements In any case a single statement like Socrates is a man or even a pair of statements connected by and rather than if then —*e g* Socrates is a man and Socrates is mortal —does not express what is commonly recognized as reasoning The motion of reasoning does however appear in this sequence of statements If Socrates is a

man then Socrates is mortal even though it omits a statement that may be necessary to the validity of the reasoning namely All men are mortal

Thus the familiar grammatical distinctions of word (or phrase) sentence and paragraph do not seem to provide a perfect parallel for the distinctions which the logicians make between terms propositions and syllogisms But this much is clear Just as a single word or phrase like man or rational animal can never express a proposition but only a term so a simple sentence expresses only a proposition and never a syllogism and a compound sentence one made up of a number of sentences expresses a syllogism only if its verbal construction somehow indicates that they form a sequence in which one *follows* from the others or if they are related in such a way that the truth of one is caused by the truth of the others

THE CHAPTER ON IDEA (and perhaps also the chapter on DEFINITION) deals with that content or act of the mind—whether a percept or a concept an image or an abstraction—which is verbally expressed in words or phrases and of which the *term* is the logical representative The chapter on JUDGMENT (and perhaps also the chapter on PRINCIPLE) deals with the mental act or content that requires a sentence for its expression and is logically represented by the *proposition* Here we are concerned with mental activity which involves not only two or more ideas but also two or more judgments so connected that the mind passes from one to another

Whether the logical structure that Aristotle calls a syllogism represents all forms of the mental activity called reasoning is one of the great traditional issues Hume suggests for example that animals reason without making use of syllogisms and Descartes and Locke seem to hold that the highest forms of thinking such as occur in mathematics or philosophy cannot be reduced to syllogisms except perhaps by a *tour de force*

We face a different sort of problem when we compare reasoning with other acts of the mind—with conception (or the having of ideas) and with judgment (or the connecting of ideas with one another in the manner which medieval writers call composition and division) No one denies that reasoning is thinking nor does anyone deny that there are forms of thinking which are not reasoning since conceiving and judging are generally regarded as kinds of thinking or modes of thought Reasoning is merely that mode of thought which is a *process*—the going step by step from one statement to another

The problem which arises from the comparison of reasoning with other modes of thought turns on the question whether the mind can learn anything without having to think rationally Can certain things be known by insight or instinct by induction or intuition rather than by reasoning? Are there truths which cannot be known by reasoning at all but only by some other mode of thought? These questions in turn raise the problem of the priority or superiority of such modes of thought as do not consist in reasoning The theory discussed in the chapter on INDUCTION—that induction is prior to reasoning because intuitive generalization from experience must provide the starting points for demonstration—indicates one solution of the problem Our present concern however goes beyond the issue concerning induction and deduction to the most general contrast between the intuitive and the rational

FOR PLOTINUS ANY FORM of thinking—not merely reasoning—signifies a deficiency or weakness In the scale of intellectual beings man occupies the lowest rank because he reasons But even the pure intelligences which know intuitively rank below the One because even the simplest act of thought involves some duality of subject and object The One according to Plotinus transcends thought even as it transcends being The super essential he says is the supra cogitative The One has no need for intellect on being always self sufficing

Other writers do not go as far as this Christian theologians do however contrast the human mind with the angelic intellect and the mind of God by saying that the latter are supra rational *i e* above the need to reason They do not like Plotinus hold that the transcendent being transcends thought itself—certainly not insofar as they discuss the divine ideas But the kind of thinking which is not an instantaneous act of vision or an immediate intuition involves

the mind in a process of thought somehow akin to change or motion and this the theologians hold cannot take place in any immutable being—the angels or God

The human intellect according to Aquinas gradually comes to know the truth by a kind of movement and discursive intellectual operation by advancing from one thing known to another But if from the knowledge of a known principle [men] were straightway to perceive as known all its consequent conclusions then there would be no place for discursiveness in the human intellect Such is the condition of the angels because in the truths which they know naturally they at once behold all things whatsoever that can be known in them

That says Aquinas is why the angels are called *intellectual* beings and men are called *rational* Recourse to reasoning on the part of men betrays the feebleness of their intellectual light For if they possessed the fullness of intellectual light like the angels then in the first grasping of principles they would at once comprehend all that they implied by perceiving at once whatever could be reasoned out of them

The type of intuitive apprehension which the angels enjoy is even more perfectly exemplified in God s knowledge In the divine knowledge according to Aquinas there is no discursiveness —no succession neither the turning from one thought to another nor the advance from the known to the unknown by reasoning from principles to conclusion The divine knowledge Aquinas explains is a single all embracing act of vision in which God sees all things in one thing alone which is Himself and therefore sees all things together and not successively Apart from participation in the vision of God through supernatural light all human thinking on the natural plane is discursive Even the conception and the judgment are discursive in the sense that the one involves an act of abstraction or definition and the other involves a composition or division of concepts But though it is always discursive human thinking is not according to Aquinas always involved in the *motion* of reasoning that is the transition from one thought to another Reasoning he says is compared to understanding —i e, the act of judgment by which we affirm or deny a single proposition— as movement is to rest or acquisition to possession

Descartes uses the word intuition to name the way in which we know certain truths immediately and with certitude He distinguishes intuition from deduction by the fact that into the conception of the latter there enters a certain movement or succession into that of the former there does not The first principles are given by intuition alone while on the contrary the remote conclusions are furnished only by deduction But while deduction which Descartes says he understands to be all necessary inference from other facts that are known with certainty supplements intuition it is never at any stage of the reasoning process independent of intuition

Not only does intuition according to Descartes supply the first principles or ultimate premises of reasoning but it also certifies each step in the process He asks us to consider this consequence 2 and 2 amount to the same as 3 and 1 Now we need to see intuitively not only that 2 and 2 make 4 and that likewise 3 and 1 make 4 but further that the third of the above statements is a necessary conclusion from these two

If in addition to knowing the premises by intuition the drawing of a conclusion from them is as Descartes says itself effected by intuition —if the act of inference rests on the intuition that the conclusion follows logically from the premises—in what way does deduction or reasoning supplement intuition? To this question Descartes replies that though the mind has a clear vision of each step in the process, it cannot comprehend in one intuition all the connections involved in a long chain of reasoning Only by taking the steps one after another can we know that the last link in a long chain is connected with the first even though we do not take in by means of one and the same act of vision all the intermediate links on which that connection depends but only remember that we have taken them successively under review

Like Descartes Locke contrasts intuition and reasoning or intuitive and demonstrative knowledge Sometimes the mind perceives the agreement or disagreement of two ideas immediately by themselves without the interven

tion of any other and this says Locke we may call intuitive knowledge When the mind cannot so bring its ideas together as by their immediate comparison to perceive their agreement or disagreement it is fain by the intervention of other ideas to discover the agreement or disagreement which it search es and this is that which we call reasoning

Again like Descartes Locke asks What need is there of reason? It is necessary he thinks both for the enlargement of our knowledge and regulating our assent Sense and intui tion reach but very little of the way The great est part of our knowledge depends upon deduc tions and intermediate ideas and in those cases where we are fain to substitute assent instead of knowledge and take propositions for true with out being certain they are so we have need to find out examine and compare the grounds of their probability But though reasoning en lar es our knowledge beyond what can be known intuitively reasoning produces certain knowledge according to Locke only if every step in reasoning has intuitive certainty

To make anything a demonstration it is necessary to perceive the immediate agreement of the intervening ideas whereby the agree ment or disagreement of the two ideas under examination (whereof the one is always the first and the other the last in the account) is found

On this view of reasoning nothing can be known demonstratively or by proof unless some things can be known intuitively *i e* without inference or proof Locke and Descartes seem to agree with Aquinas and Aristotle that dem onstration depends upon indemonstrable truths whether these are called axioms immediate propositions first principles or self evident max ims Locke and Descartes on the one hand stress the point that in reasoning the logical connection between premises and conclusion is also indemonstrable and must be intuitively perceived Aquinas and Aristotle on the other repeatedly observe that the truth of the con clusion is implicitly contained in the truth of the premises so that the advance which reason ing appears to make from the known to the un known consists in coming to know actually what is already potentially known Neverthe less they unl ke Descartes and Locke maintain that reasoning extends knowledge even though it may not be the method of initial discovery

A somewhat contrary view seems to be taken by Hume If the objects under consideration are matters of fact rather than the relations be tween our own ideas the kind of reasoning which goes from premises to conclusion avails not at all The beliefs we hold about such mat ters according to Hume result from mental operations which are a species of natural in stinct which no reasoning or process of thought is able either to produce or to prevent What he calls experimental reasoning or rea soning concerning matters of fact is founded he says on a species of Analogy which leads us to expect from any cause the same events which we have observed to result from similar causes

Not only men but also animals reason in this way But Hume thinks it is impossible that this inference of the animal can be founded on any process of argument or reasoning by which he concludes that like events must follow like objects The experimental reasoning itself which we possess in common with beasts and on which the whole conduct of l fe depends is nothing but a species of instinct or mechanical power that acts in us unknown to ourselves and in its chief operations is not directed by any such relations or comparisons of ideas as are the proper objects of our intellectual facul ties

THE FOREGOING considerations indicate how di verse theories of the role of reasoning arise from diverse theories of the nature and kinds of knowledge in animals men angels and God According as various distinctions are made be tween human knowledge and opinion or be tween the way in which d fferent objects can be known or between speculative and practical interests so too different formulations are g ven of the nature of reasoning

Aristotle s distinction for example between scientific and dialectical or rhetorical reasoning turns upon h s understanding of th difference between the objects of certain knowl dge and the objects of probable opinion Th s differenc he says makes it equally fool sh to pt prob able reaso ng from a mathematician and to demand from a rh to ician scientific proofs

Hume s distinction between *a priori* and *a posteriori* reasoning—*i.e* between reasoning from principles and reasoning from experience—depends upon his understanding of what matters must be submitted to experience and of the manner in which experience generates belief. The distinction which Aquinas makes between demonstrations *propter quid* and demonstrations *quia*—*i e* between pro ing *what* something is from its causes and proving *that* it is from its effects—depends upon his understanding of the difference between essence and existence as objects of rational knowledge

To take an example in the opposite vein, Locke s theory that the same type of demon stration is possible in both mathematics and the moral sciences, seems to rest upon his view that all knowledge consists in the comparison of ideas In contrast to this other theories, which hold that the mode of reasoning differs in dif ferent disciplines (especially in mathematics and morals or in metaphysics and the natural sci ences) seem to arise from the contrary view ng at once whatev different fields of inquiry the ob them f knowledge are different.

The type of intuitive apprehension odes of rea the angels enjoy is even more perfectly exem os plified in God s knowledge In the divine knowledge according to Aquinas, there is no discursiveness —no succession neither the turning from one thought to another nor the advance from the known to the unknown by reasoning from principles to conclusion The di vine knowledge Aquinas explains is a single all embracing act of vision in which God sees all things in one thing alone which is Himself, and therefore sees all things together and not successively Apart from participation in the vision of God through supernatural light all human thinking on the natural plane is discur sive Even the conception and the judgment are discursive in the sense that the one involves an act of abstraction or definition and the other involves a composition or d vis on of concepts

sis, in natural science as well as m[athematics] consists in going from effects to causes ... the method of synthesis goes from ... effects. writers who like Aristotle and Aqui
rd the speculative and the p actical as
though related orders of thought and
ge seem to think that practical reason
s own syllogistic f rm Practical delib
for them are d fferent from theoretic
ations The conclusion of theoretic
is an assertion that something s either
lse whereas the conclusion of prac
eration is a judgment that something
evil and therefore should e ther be
voided According to Aristotle practical reasoning of the sort which ends in a decision that leads to action takes the form of a syllogism which has one universal and one par ticular premise The major premise is a general rule of conduct the minor premise a particular perception of fact In the example Aristotle gives of the practical syllogism the major premise is the rule that *everything sweet ought to be tasted* and the minor premise is the percep tion that *this particular thing is sweet* These two premises lead to the practical conclusion that *this particular thing ought to be tasted*

Not all practical reasoning however is con cerned with reaching decisions or prompting action in particular cases The rules of conduct which decisions and actions apply may them selves be the products of practical reasoning The process by which general rules are derived from even more general principles—the pre- cepts of law or morality—involves according to Aquinas a form of thinking distinctly differ ent from the theoretic or speculative sort He po nts out in his Treatise on Law that we are able to formulate certain practical rules only by making particular determinations of universal principles not by drawing deductions from them Something may be derived from the natural law in two ways he writes first as a conclusion from premises secondly by way of determination of certain generalities The first way is like that by which in the speculat ve sciences demonstrated conclusions are drawn from the principles while the second mode is likened to that whereby in the arts general forms are particularized as to details " Of these two ways of thinking in the field of law it would appear that it is only the second type which is peculiar to the practical as opposed to the speculative order

THE DISCUSSION OF reasoning in relation to knowledge opinion and act on or in relation to different d sciplines and sciences, usually pre supposes a theory of the form which reasoning takes regardless of its subject matter or use This fact is most explicitly attested by the or der of three great books concerned with rea on ing Aristotle s *Posterior Analyt cs* deals with the theory of demonstration in the sc ences His *Top cs* deals with the theory of prob ble argu ment or reasoning in the sphere of opinion.

Both are preceded by his *Prior Analytics* which treats of the syllogism in terms of its purely formal structure and its various forms In the later tradition the distinction between the problems of the *Prior* and the *Posterior Analytics* comes to be represented by the separation between what are called formal and material logic

The formal analysis of reasoning centers on the problem of its cogency Quite apart from any consideration of the truth of its premises or conclusions reasoning is true or false according as it is valid or invalid on purely logical grounds From premises which are in fact false a conclusion which may be either true or false can be truly inferred if the structure of the reasoning is formally valid—that is if the form of the premises stands in a certain logically prescribed relation to the form of the conclusion The logical problem then is to prescribe the formal relationships among propositions which permit valid inference from certain propositions to others without regard to the content of the propositions or their truth in fact

Defining a syllogism as discourse in which certain things being stated something other than what is stated follows of necessity from their being so Aristotle says I call that a perfect syllogism which needs nothing other than what has been stated to make plain what necessarily follows a syllogism is imperfect if it needs either one or more propositions which are indeed the necessary consequences of the terms set down but have not been expressly stated as premises Using the letters S and P to symbolize the subject and predicate of the conclusion and the letter M to symbolize the middle term the term which appears in the premises but not in the conclusion Aristotle states the form of a perfect syllogism in the following manner All M is P all S is M therefore all S is P

The first of these propositions the one which contains the predicate of the conclusion is called the major premise the second the one which contains the subject of the conclusion the minor premise the subject of the conclusion is called the minor term the predicate the major term Aristotle classifies syllogisms into three figures or formal types according to the position of the middle term either as subject of the major premise and predicate of the minor in the first figure or as predicate in both or as subject in both in the second and third figures respectively Then according to whether the premises are universal propositions or particular (All M is P or Some S is M) and each is either affirmative or negative (All M is P or Some S is not M) he further distinguishes within each figure a number of valid moods or formally correct patterns of inference

For example in no figure can a valid mood be constructed with two particular or two negative premises No conclusion can be drawn from the two particular statements that some poisons are liquids and that some liquids are indispensable to life nor can any conclusion be drawn from the two negative statements that no triangles are parallelograms and no rhomboids are parallelograms In the first figure the minor premise can be particular and must be affirmative the major can be negative and must be universal In this figure the following combinations of premises— some figures are not rectangular with all rectangular figures are parallelograms or all prime numbers are odd with some odd numbers are squares —yield no conclusions In the second figure one premise must be negative Here it is impossible to draw a valid conclusion from two affirmative premises Nothing follows from the two affirmative statements that all fish swim and all whales swim In the third figure only a particular conclusion can be drawn from a pair of premises both of which are universal From the proposition that no men are wise and the proposition that all men are mortal we can conclude only that some mortals are not wise

From these examples it will be seen that Aristotle s rules of the syllogism are rules concerning the quantity and quality of the premises required in each figure to permit a valid inference and as in the third figure these rules permit only a particular conclusion to be drawn, so for all figures they determine the character of the conclusion which can be drawn from premises of a certain quantity and quality If one premise is negative the conclusion must be negative If one premise is particular the conclusion must be particular

There seems to be one universal principle of the syllogism which underlies all these specific rules for the valid moods in different figures

When one thing is predicated of another Aristotle says all that which is predicable of the predicate will be predicable also of the subject The negative aspect of this principle is immediately obvious What cannot be predicated of a predicate cannot be predicated of its subject In the tradition of formal logic this principle is sometimes stated in terms of the relation of classes rather than in terms of subjects and predicates if one class is included in a second and that second class is included in a third the first is included in the third and if one class excludes another the classes which it includes are also excluded from that other

The principle of the syllogism is traditionally called the *dictum de omni et nullo* The *dictum de omni* which Kant in his *Introduction to Logic* calls the supreme principle of affirmative syllogisms is thus expressed by him Whatever is universally affirmed of a concept is also affirmed of everything contained under it The *dictum de nullo* according to Kant states that whatever is universally denied of a concept is also denied of everything that is contained under it Kant appears to think that both these [illegible]

the syllogism is merely a special case of transitivity as it appears in the relation of implication for if P implies Q and Q implies R then P implies R
